Copyright in Germany was first regulated as respects duration by the Confederation; a resolution of which, in 1837, fixed the duration of property in literary productions and works of art at 10 years; and another resolution in 1845, extended it to the lifetime of the author, and for 30 years after his death. The laws regulating the contract of an author with his publisher varied in the different states. In Prussia, when an author assigned a C. to a publisher without any special stipulation, the publisher was entitled to issue only one edition, the extent of which he might determine. But a distinction is made between reprints or new issues (*auflagen*) and new editions (*ausgaben*). In the case of the former, the publisher is left free, on condition that he shall pay to the author, should no agreement be come to between them, on the occasion of each new issue, half the sum which he paid him for the first. New editions on the contrary, can be published by the first publisher only by entering into a new contract with the author, which must be given in writing. This privilege is limited to the author's life, though his children have a claim for a *honorarium* for each edition issued after his death. The rights of the publisher may be transferred, and those of the author descend to his heirs. When the rights which have been conveyed to the publisher terminate, the author becomes again the unlimited proprietor of the work. Copyright in Germany is now regulated by imperial legislation. The constitution of the new empire recognizes the protection of 'intellectual property,' as one of the matters to be dealt with by the Imperial Parliament. A literary treaty for six years was signed in 1883 between France and Germany.

Copyright in France exists in the author and in his widow for life, in his children for twenty years, and in his other heirs or assignees for ten years after his own death or that of his widow. In *Belgium* the same law prevails with this exception, that the right, whether in children or in other representatives, extends to twenty years after death.

International Copyright is a mutual convention between two countries to protect each other's copyright, translations included. The United Kingdom made such arrangement with Spain, Austria, Belgium, Saxony, Prussia, France, Italy, &c. Formerly the United States had ever refused to enter into any international law of C. with Great Britain; but in 1880, the draft of an international copyright treaty was laid before the British government for consideration.

The late Right Hon. James Wilson contemplated a consolidation of the C. laws, and such a measure is certainly very desirable. Amongst improvements required may be cited the following: 1. An improved system of registration. As matters are now conducted at the Stationers' Hall, any person may make any entry he pleases, with very little check in case of false pretension.

A reform in this particular should embrace a system of registration in Edinburgh, and also in Dublin, as well as in London, for the convenience of the three sections of the united kingdom; the registrar of each section to get copies annually of the other registers for general inspection. 2. A clearer understanding of the posture of articles contributed to periodicals, encyclopædias, &c. It will probably answer the main purposes of justice, if the proprietor of the work contributed to were held as having, by his stipulated payment, acquired the C., unless where a special reservation was made. 3. A protection to publishers for literary services paid under a salary. It is clearly absurd to expect that each particular article, or, say, addition to a formerly existing book, written in these circumstances, should be matter of formal assignment; and in practice no such assignment takes place. Yet, with authors disposed to take advantages, there may be cases in which the honorable understanding as to the sufficiency of salary may be no protection to the publisher from at least a harassing litigation. 4. A remedy for the great mistake made in Talfourd's act, in the extension of copyright—namely by making this extension only to the representatives of authors who had not parted with their copyrights. See also *Copyright, National and International* (1879); Jerrold's *Handbook of English and Foreign Copyright* (1881); Scrutton's *Laws of Copyright* (1883). The copyright of designs is covered by the new Act of 1883 on Patents (q. v.).

COQUEREL, ATHANASE LAURENT CHARLES, an eloquent minister of the Reformed Church in Paris. He was born in Paris in 1795, and studied theology at Montauban. Afterwards he became minister of the French church in Amsterdam, where he remained twelve years. In 1830, Cuvier induced him to return to Paris, where, till his death, he held the office of a preacher of the gospel. In 1848, he was elected a delegate to the National Assembly by the department of the Seine, but he did not appear to much advantage either in this Assembly, or in the Legislative Assembly, of which he was also a member. He wrote many works on religious subjects, history, and literature, all of which are marked by an earnest and liberal spirit. By the more rigidly orthodox of his co-religionists, C. was regarded as a heretic. He died 20th January 1868.—His son, ATHANASE JOSUE LAURENT, also a Protestant pastor of liberal tendencies, died in 1875.

COQUI'LLA NUT, the fruit of a palm, *Attalea funifera*. See ATTALEA. It now forms an article of export from South Amer-

ica, being used to a considerable extent in Britain in the manufacture of buttons and in turnery, as for making knobs of walking-sticks, umbrella handles, handles of bell-pulls, &c. It is very hard, susceptible of a good polish, and beautifully mottled with dark and light-brown. The demand for coquilla nuts seems likely to increase; and probably the fruits of some other palms may be found suitable for similar purposes.

COQUI'MBO, the name of a river, department, and city of Chili.—1. The river, rising in the Andes, enters the Pacific about lat. 29° 55′ S., and long. 71° 25′ W., and forms, at its mouth, one of the best harbors in the republic.—2. The department, extending in lat. from 25° 30′ to 31° S., and in long. from 69° to 72° W., occupies the entire breadth of the country between Aconcagua on the south and Atacama on the north. With the exception of the immediate banks of streams, it is parched and barren, being valuable chiefly for its mines of silver and copper. Physically, the region here and there presents galleries of shingle-terraces with organic remains. See CHILI. The population in 1875 was 157,463.—3. The city stands at the entrance of the river, and contains about 10,000 inhabitants. In addition to copper and silver, it largely exports chinchilla skins. The copper exported in a single year has amounted to as much as 15,000 tons. It goes mainly to England.

COQUI'TO (*Jubœa spectabilis*), a beautiful Chilian palm, of the same tribe with the cocoa-nut, rising with a naked stem to the height of 40 or 50 feet, and bearing a crown of wide-spreading pinnated leaves. By cutting off the crown, the sap is obtained in great quantity, continuing to flow for months; and when boiled down to the consistence of treacle, becomes a very sweet syrup, and forms, under the name of Palm-honey (*miel de palma*), an article of great importance in the domestic economy of the Chilians.

COR ANGLOIS, a wind-instrument of the reed species, the body of which is bent in the form of part of a circle. It is just a large oboe, and played on by oboe-players. Its compass is from F, fourth line in the bass, to B flat above the treble staff. Music for this instrument is written a fifth above the real tones.

COR CA'ROLI. See CONSTELLATION.

CO'RA, CO'RÉ, or CO'RI, a town of South Italy, 30 miles south-east of Rome. It is most picturesquely situated on a commanding elevation in the midst of olive-plantations, and crowned by the ruins of ancient temples. Two torrents dashing through deep ravines on the east and west side of the hill add romance to the situation. The town, divided into an upper and lower part by an olive-grove, is surrounded by walls, chiefly of 15th c. date, and is on the whole well built, clean, and healthy, with a population of 6000. C. preserves the name, and occupies the site, of one of the oldest cities in Italy. Virgil and Diodorus make it an Alban colony, while Pliny ascribes to it a Pelasgic origin. In any case, it was early one of the most important cities of Latium. The ancient remains still existing—including those of the old walls, a Doric temple called the *Temple of Hercules*, a Corinthian temple, consecrated to Castor and Pollux, and a fine bridge—are among the most interesting in Italy.

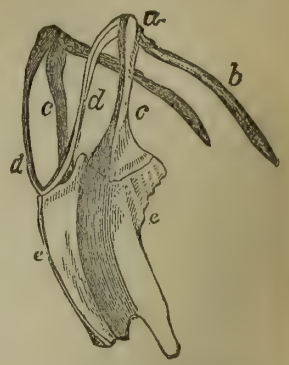
CORA'CIAS. See ROLLER.

CO'RACLE. See CURRACHS.

CORA'IS, ADAMANTIOS, called by the French CORAY, one of the most learned Hellenists of modern times, and a great benefactor of his nation, was born in Smyrna on the 27th April 1748. His father was a merchant, and he for some time also engaged in mercantile pursuits; but having from his earliest youth delighted in the study of ancient and modern languages, he relinquished business, and devoted himself to literature. He fixed his residence in Paris, and there continued to reside till his death on 6th April 1833. He published editions of many ancient Greek authors, adding notes and prolegomena, in which his patriotic zeal was often very strongly displayed. He translated into modern Greek the work of Beccaria, *Dei Delitti e delle Pene;* and by various translations and other publications, exercised a great influence in awakening the minds of his countrymen. When the Grecian war of independence began, C. was too aged to take any active part in it, but by his writings he showed his sympathy with the cause of his country.

CO'RACOID BONES. In the mammalian skeleton, the scapula or blade-bone presents a projecting bony process termed the Coracoid Process, from its supposed resemblance to a crow's beak (Lat. *korax*, a crow); and from the idea that the bones which we are now describing, and which exist in all birds, in saurian and chelonian reptiles, and in the monotremata, correspond anatomically with the comparatively slightly developed coracoid process, they have received the name which is now universally assigned to them.

As the uses of these bones are most obvious in birds, we shall confine our remarks to this class of animals. It is obviously necessary that the scapular arch should be very strong in birds, in order to form a solid resisting fulcrum to the powerful movements of the humerus and other wing-bones. The scapula (see *b* in the fig.) is a long, curved, compressed bone, extending along the back on each side of the dorsal vertebræ, imbedded in the muscles to which it gives attachment, while at its fixed extremity it assists in forming the cavity of the shoulder-joint (*a*). The coracoid bone (*c* in fig.) is the great support of the shoulder; for while at one extremity it sustains the wing, at the other it is firmly secured to the sternum by a broad and strong articulation; indeed, it forms the main resistance to the approximation of the humerus to the median plane, and retains it firmly in its lateral position. The scapula and coracoid bone are anchylosed (or united by osseous matter) at their point of union, thus forming collectively the structure popularly known as the side-bone. The clavicles, *d*, *d*, which are conjoined to form the furcula, combine to add to the stability of the whole apparatus.



Sternum of Barn Owl:
a, the glenoid or shoulder-joint cavity; *b*, the scapula; *c*, *c*, the coracoid bones, articulating at one end with the sternum or breast-bone *e*, and at the other with the scapula *b*, with the clavicle *d*, and with the humerus or great bone of the two clavicles, *d*, *d*, to form the furcula or merry-thought bone, is well shown in this figure.

CO'RAL, a calcareous secretion or deposit of many kinds of Zoophytes (q. v.) of the class *Anthozoa*, which assumes very various, and often beautiful forms, according to the different laws which govern the gemmation of the polypes of the different species. The C.-producing zoophytes are compound animals, which increase by gemmation, young polype buds springing from the original polype, sometimes indifferently from any part of its surface, sometimes only from its upper circumference, or from its base, and not separating from it, but remaining in the same spot, even when the original or parent polype has ceased to exist, and producing buds in their turn. The calcareous deposition begins when the zoophyte is still a simple polype—owing its existence to oviparous reproduction—adhering to a rock or other substance, to which the calcareous matter becomes affixed, and on which the C. grows or is built up, the hard deposits of former generations forming the base to which those of their progeny are attached. One layer of the calcareous polype cells of which the greater number of corals are composed, occasionally surrounds another like the concentric circles in the wood of exogenous trees; one layer is sometimes deposited above another; the whole structure sometimes branches like a shrub, spreads like a fan, or assumes the form of a cup, a flower, or a mushroom. Under the common name C. are included many species, also designated Madrepores (q. v.), and some have received other names derived from peculiarities of their form and appearance, as Brainstone C. (q. v.), &c.

In the greater number of kinds, besides the calcareous plates which form and separate the polype cells, and which are variously arranged according to the form and structure of the polypes themselves, there is a more solid internal or central calcareous part, formed by the additional deposition of calcareous matter at the bottom of each polype cell, or from the common living part in which the polypes are united. The calcareous framework is further strengthened by a greater or less mixture of horny animal matter with the pure calcareous substance. This calcareous framework is analogous to the cartilaginous, leathery, or fibrous framework of many other compound zoophytes, as *Alcyonium* (q. v.), *or Dead Man's Fingers*. The polypes of the common RED C. (*Corallium rubrum*) indeed very much resemble those of *Alcyonium;* but the central axis in this and other corals forming the family *Corallidæ* is quite solid, being produced in concentric layers by the living gelatinous substance, which envelopes it like the bark of a tree, and from which the polypes project like buds, or, when their tentacula are expanded, like little flowers. In the *Madreporidæ*, the general structure more nearly resembles that of *Alcyonium*. Many of them, however, have the whole calcareous framework covered as in the *Corallidæ*, by a gelatinous living substance which unites all the polypes. The whole living part soon decomposes and disappears, when the C. is taken out of the water; in some species, almost immediately running from the calcareous part as a watery slime.

Coral, showing the Polypes. (*Corallium rubrum*).

Corals chiefly abound in the seas of the warmer latitudes, where

they form extensive banks at no very great depth, and their various and bright colors present the appearance of submarine flower-gardens. Numerous species are usually combined in the formation of a single C. reef, and respectively occupy different places in it. Corals of the branching genus *Porites* usually occupy the exposed edge of the reef, and with them is associated *Millepora complanata*, a species which forms thick vertical plates, united at different angles by their edges, the outer plates only being tenanted by living polypes. In the stiller water within are many more delicate kinds, and in the quiet sheltered depths, brainstone corals and flower-like forms appear.

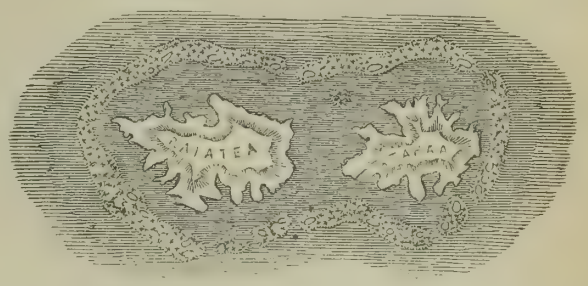
The C. of commerce, or common RED C.—so much admired for its fine color, susceptible of a high polish, and much used for ornamental purposes—is chiefly obtained from the Mediterranean, in some parts of which extensive 'coral fisheries' are carried on. It is brought up from considerable depths by means of a sort of grappling apparatus dragged after a boat or boats; the pieces being broken from the bottom by beams of wood which are sunk by weights, and then entangled among hemp. Red C. has a shrub-like branching form, and grows to the height of about one foot, with a thickness like that of the little-finger. Much of the C. of the Mediterranean is exported to India, but Red C. is also obtained in the Red Sea, the Persian Gulf, &c.—BLACK C. (*Antipathes*), the axis of which is rendered still more solid by the greater mixture of horny with calcareous matter, is still morehighly prized. —C. was known to the ancients, and was used for ornamental purposes by the Gauls.

CORAL FLOWER, or CORAL TREE (*Erythrina*), a genus of trees and shrubs, of the natural order *Leguminosæ*, sub-order *Papilioncaceæ;* of which the species, natives of tropical and sub-tropical regions, generally produce long spikes of beautiful flowers of a rich, dull crimson or scarlet color, resembling coral. The leaves have three leaflets. The *standard* of the flower is remarkably long. The C. F. of Brazil (*E. crista galii*) is common in British green-houses. The Indian C. F. (*E. Indica*) is used in the East Indies for hedges, its stem being covered with thorns. The wood is so light and spongy that it is used for the largest sizes of corks. *Jatropha multifida*, a very different plant, of the natural order *Euphorbiaceæ*, has also acquired the name of Coral Tree.

CORAL ISLANDS exist most abundantly in the tropical and sub-tropical parts of the Pacific Ocean. The formation of coral goes on, in favorable circumstances, with wonderful rapidity, for masses of coral have been found to increase in height several feet in a few months; and a channel cut in the reef surrounding a coral island to permit the passage of a schooner, has been choked up with coral in ten years. It was at one time supposed that the coral polypes began their labors at the bottom of the ocean, and reared their pile from its greatest depths; but it has been ascertained that none of them live at depths of more than twenty or thirty fathoms, and most of them are inhabitants of much shallower water. It appears, therefore, that the foundation of their still marvelous structures must be on rocks that do not reach the surface, probably in most cases volcanic rocks similar to those which, being further upheaved, form the volcanic and often mountainous islands of Polynesia.

Around these volcanic islands, which—although some of them are the largest islands of the Pacific Ocean—are far fewer in number than its C. I., a fringing reef of coral is often found immediately attached to the land; whilst in many other cases, the reef surrounds the island, the intervening space—of irregular, but nowhere of great width—forming a lagoon or channel of still water, protected by the reef from winds and waves. According to a theory proposed by Darwin (but disputed by Semper and Murray), this latter kind of reef is formed from a reef of the former or merely fringing kind, by the gradual subsidence of the rocky basis carrying down the fringe of coral to a greater depth; whilst the greatest activity of life is displayed by polypes of the kinds most productive of large masses of coral in the outer parts which are most exposed to the waves. In this manner also he accounts for the formation of true C. I., or *atolls*, which consist merely of a narrow reef of coral surrounding a central lagoon; and very often of a narrow reef—perhaps half a mile in breadth—clothed with luxuriant vegetation, bordered by a narrow beach of snowy whiteness, and forming an arc, the convexity of which is towards the prevailing wind, whilst a straight line of reef not generally rising above the reach of the tide, forms the chord of the arc. There is generally a navigable passage through the reef into the enclosed lagoon, the waters of which are still and beautifully transparent, and the depth of water close to the precipitous sides of the reef is almost always very great. The passages through the reefs surrounding the larger volcanic islands are often opposite to the mouths of streams; but even where this is not the case, there is a strong current in these channels from the flux and reflux of the tides. Islets bearing a few cocoa-nut trees often appear at intervals in the line of a low coral reef, and very generally mark the sides of passages through it. When a reef has reached the surface of the water, sand, shells, fragments of coral, and other substances, begin to accumulate, and cocoa-nut trees often grow where the waves still wash their roots. Further accumulations from the ocean, with decayed leaves, stems, &c., gradually convert the reef into fertile land. Many C. I. of considerable extent and population, are nowhere more than a few feet above the level of the sea.

Sometimes a volcanic upheaval seems to have taken place after the coral was formed, and this is supposed to have been the origin of the islands—comparatively few in number—called *Crystal Islands*, composed of coral rock, more or less modified by the action



of air, water, and other agents. Islands of this class sometimes rise to an elevation of 500 feet, and often exhibit precipitous cliffs, and contain extensive caverns. They do not exhibit, however, the picturesque beauty of the volcanic islands, nor the soft and gentle loveliness which often characterizes the true C. I.

Coral reefs sometimes include within their circuit more islands than one (as in cut). Reefs also sometimes extend to a great length in a straight line, generally parallel to a coast. There is such a reef on the east coast of Australia, extending not less than 350 miles, without being broken by a channel. For the interesting theory of Mr. Murray, opposed to Darwin's and founded on the *Challenger* observations, see a paper read by him in the Royal Society of Edinburgh in 1880 (of which an abstract is given in *Nature* for that year).

CORAL RAG, a group of the Oxford or Middle Oolite (q. v.), consisting of continuous beds of petrified corals of very variable thickness, interstratified with beds of oolitic limestone. These strata occur in the northern districts of Berkshire and Wilts, and again, with the same characteristics, in Yorkshire, while in the intermediate district the whole group seems to disappear. It attains to a maximum thickness of 190 feet. The corals retain the position in which they grew at the bottom of the sea; they sometimes form masses fifteen feet thick. The characteristic genera are *Isastræa*, *Thamnastræa*, and *Thecosmilia*. With them are associated the remains of mollusca and echinodermata.

CORAL SEA, so called from the substance of its numerous reefs, is that section of the Pacific which stretches between Australia on the west and the New Hebrides on the east. Its general depth must be very considerable, for soundings of 2150 fathoms, or nearly 2½ miles, have been obtained in lat. 13° S., and long. 162° E.

CO'RALLINE (*Corallina* and *Corallinaceæ*), a genus and family of marine *Algæ*, of the sub-order *Ceramiaceæ*, remarkable for rigidity, which is mostly owing to a calcareous incrùstation. When the calcareous matter is removed by a weak acid, the resemblance to other *Ceramiaceæ* becomes very apparent. The common C. (*C. officinalis*), extremely abundant on the British coasts, at first appears as a thin, round, shelly, purplish patch, on a smooth rock, the shell of a mollusc, or the frond of a seaweed, gradually enlarges, and usually sends up a frond of jointed branching filaments, in a bushy tuft, an object of great beauty in the rock-pools.

Although, as its name imports, this C. was once *officinal*, it has no medicinal virtues. Some of the corallines expand into leafy lobes, usually fan-shaped. Corallines are most abundant in tropical seas, and there display their greatest beauty.

The name C. is often popularly given to zoophytes of the class *Anthozoa*, and genera *Sertularia*, *Thuiarea*, *Antennularia*, *Plumularia*, *Laomedea*, *Campanularta*, &c., having branching polypidoms and hydraform polypes, of which the British coasts produce many small but extremely beautiful species.

CO'RANACH, CORANICH, CRONACH, &c., a funeral dirge, formerly in use among the Irish and Scottish Celts. The word is probably derived from the Gaelic *cornh-rànaich*, a crying together. 'The cries (coranich) are called by the Irish the Ulagohne and Hululu, two words extremely expressive of the sound uttered on these occasions (funerals); and being of Celtic stock, etymologists would swear to be the origin of the *ololugon* of the Greeks, and *ululatus* of the Latins'—Pennant's *Tour*.

The C. seems to be identical with the Irish *caóine*, generally

written and pronounced *keen*, a dirge for the dead, 'according to certain loud and mournful notes and verses,' wherein the pedigree, property, the good and great deeds of the deceased, and the manner of his death are recounted, in order to excite sorrow or revenge in the hearers, and to show them the loss they have sustained.

The word, in one or other of its forms, occurs in the writings of many of the ancient Scottish authors:

'Cryand for you the cairfull corrinoch.'
Sir D. Lindsay.

'Cryand the corynoch on hie.'
Battle of Harlaw.

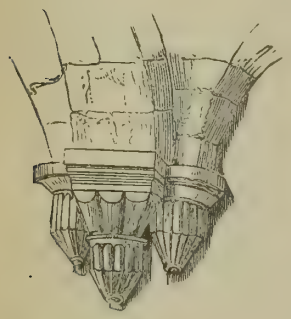
'Be he the correnoch had done shout.'
Dunbar.

The C. has long since fallen into disuse among the Highlanders. The funeral lament performed on the bagpipes, which may be considered as an instrumental C., lingered on till the latter half of the 18th century.

For specimens of the C., see Sir Walter Scott's *Lady of the Lake*, and accompanying notes; Crofton Croker's *Researches in the South of Ireland;* and *Blackwood's Magazine*, vols. xiii. and xxiii.

CORA'TO, a large town in Southern Italy, 25 miles west of Bari, is situated on a fertile plain. Pop. (1881) 30,428. It is an ugly, dirty town, with a fine church.

CO'RBEL (Fr. *corbeille*, a basket). In architecture, this term, adhering originally to its etymological meaning, signified an ornament in the form of a basket, like those sometimes set on the heads of caryatides. In Gothic architecture, to which it is now almost peculiar, it is applied to any kind of ornamented projection used for supporting pillars or other superincumbent weights.



Corbel:
Kirkstall Abbey.

Corbel:
Duston, Northamptonshire.

Here also its form probably was at first that of a basket projecting from the wall, in which the end of the pillar was placed, and on which it rested. Latterly, the more ordinary form was that of a head, with the face looking outwards or downwards. In this form it is found in all the styles. A recumbent animal, again, is sometimes placed under the pillar, and there are a great variety of other forms. When any construction is carried out, so as to rest on corbels, and to project beyond the face of a wall, it is said to be *corbelled out*. See BRACKET, CANTALIVER, CONSOLE.

CO'RBIE, a heraldic term for a raven. See CORBIE-STEPS.

CO'RBIE-STEPS, or CROW'-STEPS (Fr. *corbeau*, Lat. *corvus*,

Fig. 1.

a crow). The word corbie or corby, though obsolete in English, except as a heraldic term, has retained its place in the Scottish dialect, and in architecture C. signify the succession of steps with which the gables of old houses are everywhere ornamented in Scotland. The fashion, like most of the other peculiarities of Scottish architecture, was no doubt borrowed, as was the term, from France. In the domestic buildings of Edinburgh, it is found in the highest degree of prevalence between 1620 and 1640. The notion, of course, was that the steps were for the use of the crows.

Fig. 2

This gable ornament is by no means peculiar to France, but is met with in Flanders, Holland, and all over Germany. Parker, in his *Glossary*, gives an illustration from Cologne; and the accompanying illustration, No. 1, represents the gable of a house in Nuremberg, which it will interest the student of Scottish domestic architecture to compare with the illustration No. 2, which is taken from a house in the Castle Wynd of Edinburgh.

CO'RCHORUS, a genus of plants of the natural order *Tiliaceæ*, having five sepals, five petals, numerous stamens, and a capsule; and containing a number of species, both shrubby and herbaceous, natives of the warm parts of the globe. *C. olitorius* is widely diffused in tropical countries, and is supposed to be a native of Asia, Africa, and America. It is an annual, with a smooth, more or less branching stem; varying in height from two to fourteen feet or upwards, according to soil and climate. It has smooth, stalked, alternate, oval, or ovatolanceolate leaves, and small yellow flowers, solitary or in pairs on foot-stalks. It is much used as a pot-herb, and is called JEWS' MALLOW, from being much cultivated by Jews in Syria and other parts of the East. It is still more valuable for the fibre of its inner bark, as is also *C. capsularis*, a species very similar, but distinguished by the want of transverse partitions in its capsule. Both are much cultivated in India, yielding the greater part of the JUTE (q. v.) of commerce, and of the fibre employed in making *Gunny Bags* (q. v.). *C. capsularis* being extensively cultivated in China, is sometimes called CHINESE HEMP.

The Japanese shrub, now very common in Britain, and still very generally known as *C. Japonicus*, was ranked in this genus when botanists were very imperfectly acquainted with it, but belongs to the genus *Kerria*, of the natural order *Rosaceæ*.

CO'RDAGE, a seaman's name for the running rigging of a ship, as distinguished from the standing rigging. The name is also given to the store of rope kept in reserve. See RIGGING, ROPE.

CORDAY D'ARMANS, MARIE ANNE CHARLOTTE, known as CHARLOTTE CORDAY, was born at St. Saturnin, in the department of Orne, in 1768. Though descended from a noble family, she early imbibed revolutionary principles, but was horrified at the monstrosities of the Jacobins; and her hatred of their acts was intensified by converse with a party of proscribed Girondists, who had fled to Normandy. She resolved to rid her country of one of the principals of the Jacobin faction, and with that view traveled to Paris. Whether to slay Robespierre or Marat, was an open question with her; but while she was debating the matter with herself, a demand of the latter for a hundred or two hundred thousand more victims for the guillotine, marked him out for her weapon. Twice she sought admission to Marat unsuccessfully, but on a third occasion (July 13, 1793), was admitted on the plea that she had important news from Caen to communicate. She found Marat in his bath, who, to some statement she made, declared that the Girondists who had fled to Normandy, some of whom were her own friends, would be guillotined in a few days. She no longer hesitated, but plunged her dagger into the monster's heart, who expired with a single groan. She was at once arrested, and brought before the Revolutionary Tribunal, where she boldly avowed and justified her act. She was of course condemned to the guillotine, and the sentence was carried into effect on the 17th July 1793. Her beauty added greatly to the interest which her sanguinary heroism inspired.

CORDELIERS ('cord-weavers') was the name applied, in France to the strictest branch of the Franciscan friars, on account

of their wearing a girdle of knotted cord. At one period, this order had no less than 284 male and 123 female convents. During the Revolution, the name was applied to the members of a political club which assembled in the chapel of a Franciscan monastery, and exercised (chiefly in Paris, however) great influence on the progress of the revolution. It was instituted in 1790. Its leaders were men of various opinions, including Danton, Hébert, Camille Desmoulins, and Marat. The C. were generally opposed to the Jacobins (q. v.); but it may be asserted that in these two clubs all the great popular movements of the revolution had their origin. In the session of the C., May 22, 1793, the insurrection which marked the close of the Reign of Terror was plotted. While the club was at the height of its influence, Camille Desmoulins commenced to issue his popular journal, *Le Vieux Cordelier*. Soon after the fall of Danton, the C. club lost its influence, and was an insignificant affair when it was closed by the Convention.

CO'RD-GRASS (*Spartina*), a genus of grasses having compound spikes, the spikelets arranged on one side; and having only one perfect floret, and very unequal glumes. One species, *S. stricta*, found in muddy salt-marshes on the east and south-east coasts of England, although remarkable for its extreme stiffness and rigidity of habit, is used for making ropes, on account of the toughness of its fibre.

CORDIA'CEÆ, a natural order of exogenous plants, closely allied to *Boragineæ*, from which it differs chiefly in its drupaceous 4—8 celled fruit. It consists of trees with rough leaves, chiefly natives of the tropics, although some are found in cool parts of South America. The fruits called Sebesten (q. v.), or Sebesten Plum, belong to this order, and to the genus *Cordia*; which also contains some valuable timber-trees, particularly the Spanish Elm, Prince Wood, or *Bois de Chypre* of the West Indies (*C. Gerasacanthus*). It is a dark-brown wood, faintly striped, tough, elastic, and fine grained.

CORDI'LLERAS (so in England: Spanish *Cordille'ra*). The word *Cordillera* literally signifies a chain, and is applied in Spanish America to a chain of mountains. The C. of South America are described under Andes. Those of Central America extend from the commencement of the Isthmus of Darien to the north of Mexico and California, and spread themselves, to speak generally, from sea to sea, presenting many diversities, and occupying the states of New Granada, Costa Rica, Nicaragua, Honduras, San Salvador, Guatemala, the Mexican Confederation, and New Mexico. They gradually increase in elevation from the Isthmus of Panama, where at one point they are only 260 feet high, until, in Mexico, they reach a height of more than 17,000 feet, and form magnificent plateaux.

CO'RDON, in military operations, is a line of sentries enclosing or guarding any particular space of ground, to prevent the passage of persons other than those belonging to the army. The sentries are placed within sight of each other. If intended to guard against contagious diseases it is called a *C. Sanitaire*.

CO'RDOVA, or CO'RDOBA, a city of Spain, capital of the province of Cordova, is situated in the midst of olives and palm-trees on the Guadalquiver, here crossed by a stone bridge of 16 arches, constructed by the Moors. Lat. 37° 52′ N., long. 4° 49′ W. Its old Moorish walls and convent-crowned hill in the background give it quite an Oriental aspect; but its beauty, like most Oriental beauty, is merely external; inside, its streets are narrow, dark, and dirty, with a general appearance of decay. Many gardens are enclosed within the walls. Among the principal buildings is the cathedral, formerly a Mohammedan mosque, an immense structure dating from the 8th c., and generally regarded as the finest type of a Moslem temple in Europe. Internally, its columns composed of various colored marble, jasper, and porphyry, form a perfect grove, there being still some 850 remaining though at one time there was about half as many more. The bishop's palace, an old residence of the Moorish kings now used as stables, and several of the churches and convents, are also noteworthy. C. was at one time celebrated for its manufacture of Cordovan (q. v.), but that has now greatly declined. Its silversmiths and filigree workers have still a good reputation; and there are manufactures of paper, silken fabrics, hats, &c. Its inhabitants are proud, above even the pride of Spaniards. Pop. 49,900. C. is a very ancient place, having been founded by the Romans as Corduba, 152 B.C. Cæsar 45 B.C., put 22,000 of its inhabitants to death for having sided with Pompey. Taken by the Goths in the 6th c., it soon after fell into the hands of the Moors, and became the capital of the Moorish empire in Spain. From the 9th c. to the 12th c., it was one of the greatest centers of commerce in the world, and is said to have contained a million inhabitants. It was taken by Ferdinand III. of Castile in 1236, and never afterwards regained its prosperity. In modern times, C. was taken and plundered by the French under Dupont in 1808. C. is the birthplace of the two Senecas, the poet Lucan, and the astronomer Averroes. The province of Cordova has an area of 5159 square miles, and a pop. (1877) of 385,582. See Andalusia.

CORDOVA, the capital of a state of the same name in the Argentine Confederation (q. v.), is situated on the Rio Primero, a tributary of the Parana, in lat. 31° 26′ S., and long. 63° 55′ W. It was founded by the conquerors of Tucuman in 1573. It has a cathedral and several churches, with a population of 28,523. The state of which C. is capital is situated near the center of the Confederation, and contains about 57,275 square miles, with a population, in 1869, of 210,508, who occupy chiefly its western section. Cattle, sheep, and goats are numerous; and the soil is much fitter for maize and fruits than for wheat. The surface is mostly mountainous; and the ranges, which here and there are 2500 feet above the sea, are interspersed with barren flats of stone and sand.

CO'RDOVAN, a species of leather prepared from goat-skins. It was originally, and at one time exclusively, manufactured by the Moors of Cordova, and hence its name. The best C. still comes from the Levant. It is used in bookbinding, and in the finer kinds of boot and shoe making.

CORDYLINE. See Ti.

CORE'A, a peninsular kingdom of Eastern Asia, tributary to China; lat. 34° 40′ to 42° 30′ N., and long. 125° to 129° E., with an area estimated at 91,000 square miles. It is bounded E. by the Sea of Japan; S. by the Yellow Sea; W. by the Yellow Sea and Gulf of Pechili; and N. by the rivers Ya-lu and Tu-mên, which separate C. from Chinese and Russian Mantchuria respectively. These rivers take their rise from the eastern and western slopes of the vast desert mountain-tract of Ch'ang Peh Shan. Other considerable rivers are the P'ing Jang, discharging into the Yellow Sea in lat. 39°; and the Han, also flowing west, near the mouth of which is the capital, Séoul or Saul (Chinese, Wang King). All accounts represent the country as mountainous throughout, densely wooded in some districts, with valleys moderately fertile. The climate, which in the north is glacial, is elsewhere like that of Japan. There is ice and snow everywhere in winter. The rainfall of C. is excessive.

There is good reason to connect the people with the Tungusic stock that has peopled the whole of Northern Asia. The features of the Coreans are more pronouncedly Mongolian than those of the Japanese, whom they most resemble. The language, differing widely from both Chinese and Japanese, resembles the latter in its polysyllabic form and alphabet of 27 letters, and has affinity with the existing Mongolian tongue. The native alphabet and writing is almost disused; the Chinese character is everywhere known. The religion of C., like its other official institutions, is based on that of China; the Chinese state gods are everywhere worshiped; Buddhism and Taoism have their votaries; and the literati profess the Confucian Ethics.

The monarchy is a despotism limited by the existence of privileged ranks and hereditary nobles. The officials are selected. The life of the Coreans is very primitive; the chief articles of food are inferior kinds of rice and grain. Agriculture is very backward. A little tobacco, cotton, and silk is produced. The principal fabrics are of coarse hemp. The only products bartered with the Chinese are paper and ginseng. Mineral treasures abound; small quantities of gold, silver, iron, copper, and lead are mined; and the Coreans are skilful in working metals. The pop. is variously estimated at from 7,000,000 to 13,000,000.

C. has steadfastly maintained a policy of strict isolation towards all outsiders, even towards the Chinese, with whom there is no intercourse save on occasion of the annual embassy, which is accompanied by a few privileged traders, and of the periodical fairs at the 'Gate-town,' near the city of Fêng-hwang, in Mantchuria. The Chinese dislike to everything foreign is strengthened in the case of C. by traditions of ancient enmity between China and Ch'ao-sien, as C. was called in the 2d century B.C. The Mongol conquerors of China reduced C. also; but the Ming dynasty restored the Corean sovereign with the title of Kaoli-Wang (from which word Kaoli, through the Japanese form Ku-rai, comes the name Corea). Strange to say, the seeds of Christianity were sown in C. in 1592 by the invading army, composed chiefly of Christian converts, of the Japanese usurper, Taicosama. Hamel, a Dutch sailor, was wrecked here, and detained for thirteen years; from his narrative it was that, till very recently, most of our scanty knowledge of C. was obtained. In 1784, Jesuit missionaries found their way into C., and had great success amongst the people. From 1835 till 1866, several intrepid and devoted French missionaries contrived to find shelter; and in spite of incessant persecutions, the Christian community continued rather to increase, rising again, in 1852, to 11,000 souls. The massacre of nine missionaries, in 1866, led to an invasion of C. by a small French force, but without success. Nor did two successive American expeditions, provoked by an attack on an American vessel, succeed in contributing at all to break down the barriers that have so long separated the Coreans from the rest of the world. Japan

which claims sovereign right in C., obtained, in 1876, leave to trade with several Corean ports. The Russians have long been suspected of waiting for an opportunity to seize an admirable harbor, Port Lazareff, just within the Corean frontier: and moved by fear of Russian aggression, the Chinese agreed, by treaty with the United States, in 1882, to open four Corean ports to foreign commerce. Shortly after this a bloody rebellion broke out in C. It has of late been denied that C. is dependent on China; but the truth is, that though it is, and acts as a sovereign state as to laws, administration, and the treaties it has made with Japan, it does from time to time send tribute to Pekin, and each new sovereign is recognized by the Emperor of China. See *Journeys in North China*, by Rev. A. Williamson (1870); *C., The Hermit Nation*, by W. E. Griffis (1882); *C., Ancient and Modern*, by Rev. John Ross (1880); and *A Forbidden Land*, by E. Oppert (1880).

CORE'GONUS, a genus of fishes of the family *Salmonidæ*, having the first dorsal fin further forward than the ventrals, and higher than it is long, the scales large, the teeth either minute or wanting. The species are numerous, and some of them inhabit the sea, others fresh water. To this genus belong the Gwyniad of the lakes of Wales and Cumberland, the Powan of Loch Lomond, the Pollan of the lakes of Ireland, &c. From their herring-like appearance, the Gwyniad and Powan are often called *Fresh-water Herring*. Some of the species found in the lakes and rivers of North America are also known as *Herring Salmon;* but a more valuable species, regarded as one of the finest of all fish, is the WHITE FISH (*C. sapidus* or *albus*) of North America. Other species are found in the rivers and lakes of Europe, even to the North Cape, in those of Siberia, &c.

CORE'LLI, ARCA'NGELO, surnamed *Il Divino*, an Italian musical composer, was born at Fusignano in the Bolognese, in 1653. He visited Paris and Germany as a violin-player, but ultimately settled at Rome. His compositions, including concertos, sonatas, minor pieces for the violin, mark an epoch in chamber music, and had great influence on later composers, as Bach. He died in 1713.

CORENTY'N, a river of Guiana in South America; rises in lat. 1° N., having its head-waters 25 miles to the east of those of the Essequibo. With a generally northerly course, it separates the Dutch and British portions of the country; and at its mouth, in lat. 6° N. and long. 57° W., it forms an estuary of 25 miles in width. It is navigable for boats about 150 miles upwards, measured by its windings; and at a point still higher, it was found to be 900 yards across.

CORFE CASTLE, a village in the middle of Purbeck isle or peninsula, in the south of Dorsetshire, 24 m. E.S.E. of Dorchester. In the vicinity are stone and marble quarries, and clay-works for the potteries. Pop. of parish (1871) 1806. A castle, giving its name to the village, stands on the neighboring hill. It seems to have been founded in the 10th c., and was long one of the strongest fortresses in the kingdom. Here King Edward the martyr was murdered by his stepmother, Elfrida, about 980, and King John, during his disputes with his barons, kept his regalia here for safety. Here also, in 1642, Lady Bankes defended the castle for six weeks against Charles I. It was dismantled by Fairfax in 1645.

CO'RFU, the most northerly of the Ionian Islands (q.v.), in lat. 38° 40′—39° 40′ N., long. 19° 10′—20° E. It has a length of about 36 miles, with a breadth varying from 3 or 4 to 20 miles. Area, 427 square miles. Pop. (1879) 106,109. Like the rest of the Ionian Islands, it is mountainous, and the mountains are generally naked and dry, the highest summit, Pandokrátora, being between 3000 and 4000 feet above the sea. The valleys, however, are very fertile, and yield olive-oil, wine, honey, oranges, figs, &c. Salt is also produced in some quantity.

The climate is generally mild and healthy. The principal town, Corfu, underwent great improvements during the British protectorate, and is copiously supplied with water. It is situated on an elevation, has some good streets and a fine esplanade. The town, with about 17,000 inhabitants and a considerable trade, is the seat of an archbishop of the Greek Church, and of a Latin bishop. The principal institutions are the penitentiary, the lunatic asylum, the infirmary, foundling hospital, &c. The University, founded by Lord Guildford in 1823, now represented by a lyceum, was suppressed when (in 1864) the Ionian Islands were incorporated with the kingdom of Greece. At the incorporation it was stipulated that Corfu and Paxo were to enjoy perpetual neutrality. The language spoken is considered the softest of the modern Greek dialects—The ancient name of the island of C. was *Corcyra*. It is said to have been occupied first by the Phæacians, and then by the Liburnians; but the accounts of it are somewhat mythical until its settlement by the Corinthians about 734 B.C., and through its commerce it soon after required a considerable importance. It soon quarrelled with the mother-country, and after many vicissitudes of fortune, passed under the dominion of the Romans about 229 B.C.

CORIA'NDER (*Coriandrum sativum*), an annual plant of the natural order *Umbelliferæ*, with branching stem, 1—2 feet high, the lower leaves bipinnate, the upper leaves more compound, and globose fruit. It is a native of the south of Europe and of the east, and has long been cultivated for the sake of its fruit; and has thus become naturalized in some parts of England, although its fruit (*C. seed*) is much less used in Britain than in Germany, and some other European countries. The whole plant, when fresh, has a very offensive smell; but the ripe and perfectly dry fruit has an agreeable aromatic smell and a sweetish aromatic taste. It is used in medicine as a carminative, and as a corrective of certain purgatives; also in domestic economy as an aromatic, being very often mixed with bread in the north of Europe; spirituous liquors are flavored with it; and confectioners cover it with sugar, to make a well-known kind of comfit. In the south of England, it is common to sow C. and caraway together, the C. yielding a crop in the first year, and the caraway in years following. C. delights in a rich soil, and is much cultivated and used in India.

CORIGLIA'NO, a town of Italy, in the province of Cosenza, about 4 miles from the Gulf of Taranto, beautifully situated on a hill, round which it is built in the form of an amphitheater, a fine old castle crowning the summit. The base of the eminence is clad with lemon and orange groves, amid which rise some elegant villas; the whole rendering C. one of the most agreeable places in the Calabrias. It has extensive liquorice manufactories, and a trade in wine and fruits. Pop. 10,600.

CORI'NGA, a maritime town in the collectorate of Godavery and province of Madras, stands on the south side of the estuary of a river of its own name, one of the branches of the Godavery. Its harbor is breasted by a bar, which at spring-tide shows a depth of 12 or 14 feet. Besides having a considerable general trade, it is the best place on the coast for the building and repairing of small vessels. It has been twice destroyed by inundations of the sea. In May 1787, during the north-east monsoon, the tide overwhelmed the city and the adjacent country, drowning about 15,000 people; and again in 1832, a similar deluge occurred, leaving behind it, besides the more ordinary traces of its power, several ships lying high and dry in fields in the neighborhood. Pop. (1871) 5649.

CORI'NNA, a Greek lyric poetess, famous alike for her beauty and genius, was born at Tanagra, in Bœotia. The date of her birth is not known, but she flourished about 500 B.C. She lived principally at Thebes, and hence is sometimes called a Theban. Ælian states that on five different occasions she vanquished her contemporary, Pindar, in a poetic contest, but Pausanias alludes to only *one* victory of hers. Her townsmen showed their appreciation of her genius by placing a statue of her in their gymnasium. She was surnamed *Muia* ('the Fly'), probably on account of the tenderness and softness of her poems. Of her numerous poems, which were composed in the Æolic dialect, only a few fragments remain, which have been published by Schneidewin, in his *Delectus Poetarum Græcorum* (Gött. 1839), and by Bergk, in his *Lyric Poetæ Græci* (Leip. 1843).

CO'RINTH (originally called *Ephyre*), a famous city of antiquity situated on the Isthmus connecting the northern division of Greece, or Hellas proper, with the Peloponnesus. Its citadel was the Acrocorinthus, an isolated hill 1886 feet high, separated from the Oneian range on the north of the isthmus by a ravine, and forming, in the opinion of Colonel Mure, the most gigantic natural citadel in Europe, neither the Acropolis of Athens nor the fortress of Gibraltar being able even remotely to compete with it. At the northern foot of this hill lay the city of C., on a broad level rock nearly 200 feet above the level of the isthmus. It was probably founded by the Phœnicians, who had various settlements on the Grecian coast, and who could hardly have failed to notice the extraordinary maritime advantages of its situation. According to its legendary history, however, it was founded by Sisyphus, the Æolian, about 1350 B.C. It was then conquered by the Heracleidæ, who ruled as an oligarchy for twelve generations, when they were expelled by Cypselus, the father of Periander, with the help of the populace, 657 B.C.

After a period of 77 years, the Spartans—the great enemies of democracy in Greece—established again a sort of aristocratic government, and C. now figures in history as the close ally of Sparta. In the Peloponnesian war, it at first furnished the greater part of the fleet employed against the Athenians, but afterwards became jealous of the Lacedæmonian power, and was induced to league with other Grecian states against it, 395 B.C. The war which ensued is known as the *Corinthian War*, and lasted till the peace of Antalcidas, 387 B.C. In the strife which broke out between Thebes and Sparta, C. remained faithful to the latter. After the battle of Chæroneia, 338 B.C., in which the liberties of Greece were crushed by the Macedonians, it was garrisoned and held by the latter.

Subsequently, it was the center of the Achæan league formed against the Romans, and in revenge was utterly destroyed (146 B.C.) by L. Mummius, the Roman general. For a whole century it continued in ruins. In 46 B.C., Julius Cæsar rebuilt it, and made it the capital of Achaia; and although it never again attained its former importance, it became both prosperous and powerful. St. Paul planted a Christian church here, to which he also addressed two epistles. Pausanias, who visited it in the 2d c. A.D., states that it then contained many public buildings. From the Western emperors it passed into the hands of the Venetians. In 1458 A.D. it was conquered by the Turks under Mohammed II., recovered by the Venetians in 1687, and retaken by the Turks in 1715,,who held it till 1823. Reduced to ashes in the revolutionary war, and again utterly destroyed by an earthquake in 1858, C. was gradually rebuilt in a more convenient position near the shore of the Gulf of C. Its pop. is about 2000.

Ancient C. was surrounded by walls which included the Acrocorinthus, and had two harbors—*Lechæum*, on the Crisæan Bay (now the Gulf of Lepanto), opening into the Adriatic, and Cenchreæ, on the Saronic Gulf (now the Gulf of Athens), opening into the Ægean. The former was connected with the city by two parallel walls. The vast wealth of its merchants was the bane of Corinth. It became notorious as the most licentious city in all Greece, and was the favorite resort of courtezans. The patron goddess of the city was Aphrodite, in whose temple, on the Acrocorinthus, were kept more than a thousand 'sacred female slaves' (*hierodouloe*) for the use of strangers. C., however, has better claims to remembrance. The art of painting is said to have been invented here, and at the time of its capture by the Romans, it possessed some of the finest pictures in Greece. Among these, was the picture of Bacchus, by Aristides, for which Attalus offered 600,000 sesterces. Architecture, statuary, and bronze-work also flourished, and earlier, during the reign of Periander, poetry was cultivated, Arion having either invented or improved the dithyramb in Corinth. Afterwards, however, no attention was paid to literature by the inhabitants, and it has been noticed that 'among the illustrious writers of Greece not a single Corinthian appears.'

CORINTH, GULF OF, or GULF OF LEPA'NTO. An arm of the Mediterranean extending from west to east through the center of Greece, from the Ionian to within about 5 miles of the Ægean Sea, thus almost dividing the kingdom into two parts, the Morea forming the southern portion. Its greatest length is about 75 miles, with an average breadth of 15 miles. The outline of the coast is exceedingly varied, and the scenery is everywhere as attractive as it is rich in contrast. The narrow neck of land, separating the Gulfs of C. and Egina, and uniting the Morea to Attica, is called the ISTHMUS of Corinth. It is variously estimated, accordingly as it is measured from different points, at from 10 to 20 miles in length, and its breadth varies from 4 to 8 miles. The project of cutting through this isthmus was early entertained, and attempted by Nero without success. This scheme took practical shape in 1882, when the cutting of a canal four miles in length from the G. of C. to the Bay of Ægina was commenced with much ceremony by the king and queen of Greece. A strong wall, flanked with towers, was anciently built across the isthmus. The celebrated Isthmian games were contested upon this tract.

CORI'NTHIAN O'RDER. See COLUMN.

CORINTHIANS, EPISTLES TO THE, were written by St. Paul, 57 or 58 A.D. The first was composed at Ephesus; the second, according to general opinion, at Philippi, but this is doubtful. The genuineness of both is all but universally recognized. From the contents of 1 Cor., chap. 5, verse 9, it has been concluded by many theologians that Paul must have written a previous epistle, now lost.

CORIOLA'NUS, CAIUS or CNÆUS MARCIUS, a Roman patrician, surnamed, according to the half-fabulous legend, C., on account of his capture of the town of Corioli, belonging to the Volsci (493 B.C.). Of a proud and haughty spirit, he was strongly opposed to the plebeians, whom he looked upon as the 'enemies' of his order; and on one occasion, during a time of famine, he argued in the senate against a gratuitous distribution of the corn which had arrived from Sicily, and insisted that the plebeian tribunes, lately instituted, should first be discharged from office. For this he was impeached, and banished. He took refuge among the Volscians, whom he aided in their war with the Romans. His victories at the head of his Volscian troops alarmed the Romans, who, on his approach to their city, sent a variety of deputations to plead with him. He was deaf to every entreaty. At last, the noblest matrons of Rome, headed by his old mother and his wife Volumnia, leading her two children, came to his tent. His burning desire to be revenged on those who had dishonored him was cooled by the tears of his relatives, and he led back the Volsci to their own territories, where he lived to an advanced age. Shakspeare has written a play on the subject, in which the character of C. is conceived in the grandest and most aristocratic style.

CORK (Span. *corcho*, from Lat. *cortex*) is the unusually developed *epiphlœum* (see BARK) of the bark of the C.-tree or C.-OAK (*Quercus suber*), the *Alcornoque* of the Spaniards, a species of Oak (q. v.), a native of the south of Europe and north of Africa. Spain and Portugal chiefly supply the world with C., and in these countries, the tree is often planted for the sake of the cork. The C.-tree is not of great size, generally 20—40 feet high, much branched, with ovate-oblong evergreen leaves, which are sometimes entire, and sometimes sharply serrated. The acorns are eatable, and resemble chestnuts in taste. The bark in trees or branches from three to five years old acquires a fungous appearance, new layers of cellular tissue being formed, and the outer parts cracking from distension, until they are finally thrown off in

Cork Tree.

large flakes, when a new formation of the same kind takes place. C. intended for the market is generally stripped off a year or two before it would naturally come away, and the process is repeated at intervals of six or eight years. The bark of young trees and branches is either useless or of very inferior quality; it is only after the third peeling that good C. is produced. The removal of the C., being not the removal of the whole bark, but only of external layers of spongy cellular tissue, all or greater part of which has ceased to have any true vitality, and has become an incumbrance to the tree, is so far from being injurious, that when done with proper care, it rather promotes the health of the tree, which continues to yield crops of C. for almost 150 years. In stripping off the C., longitudinal and transverse incisions are made to the proper depth, and each piece is then cut away from the tree by a curved knife with two handles. The pieces are soaked in water, pressed flat, dried, and superficially charred, to remove decayed parts and conceal blemishss, before they are packed in bales for the market. Besides the use of C. for stopping bottles, casks, &c., it is much used, on account of its lightness, for floats of nets, swimming-belts, &c.; and on account of its impermeability to water, and its being a slow conductor of heat, inner soles of shoes are made of it. All these uses are mentioned by Pliny; but the general employment of corks for glass bottles appears to date only from the 15th century. The *Spanish Black* used by painters is made by burning C. in close vessels, and the parings of C. are carefully kept by C.-cutters for this purpose. There are many other applications of this valuable substance in the arts, which cannot here be detailed.

The C.-tree is occasionally planted in the south of England, but the climate is not sufficiently warm.

The wood of some trees possesses the cellular sponginess, lightness, and elasticity of C. in such a degree as to be sometimes substituted for it in many of its uses, as that of the *Anona palustris* (Corkwood, or Alligator Apple) in the West Indies, &c.

CORK-CUTTING. The bark, after being cut into square pieces or sheets, is pressed, to remove its natural curvature and flatten it. If it is found that simple pressure has not flattened it sufficiently, it is heated on the convex side, and the contraction thus produced straightens it. It is then cut into slips, and these slips into squares, according to the required size of the corks. These are rounded by the cork-cutter by means of a broad sharp knife; the cork is held in the left hand, and rested against a block of wood, and the knife pushed forward, and at the same time its edge is made to describe a circular curve by a skilful turn of the wrist. The knife requires continual sharpening; the workman has a board before him on which the knife is rubbed on each side *after every cut*.

Many attempts have been made to cut corks by machinery. A patent C. company was established a few years since, but it failed. The chief difficulty in applying machines to this purpose arises

from the necessity of continually sharpening the knife or cutters, for it is a curious fact, that so soft a substance as cork blunts the tools used in cutting it far more rapidly than do the hardest or toughest of metals. A cork-cutter's knife requires sharpening every second, while the tool that is used for planing, turning, or boring steel will work continuously for hours without sharpening. In most of the machines, the corks, after being cut into squares of the required length, are made to revolve on grasping spindles; and cutters of various forms, such as revolving cutter-wheels, hollow cones with internal cutters, reciprocating blades, toothed cutters, &c., are brought to bear upon the revolving cork.

CORK, Rock. See Asbestus.

CORK, a city and parl. borough of Ireland, capital of the county of the same name, and a county in itself, on the Lee, 11 miles above its discharge into the sea, stands in the center of a picturesque valley. It is built in part on an island, formerly a swamp, which the word *Cork, Corcoch*, or *Corcagh* implies; in part, on the N. and S. slopes of the river-banks. The houses are generally of old red sandstone. Nine bridges cross the river to the central islands. There is a spacious public park, and a walk above a mile long, lined by noble elms, on the west of the city. There is also a handsome public cemetery. C. has a pleasant picturesqueness from its uneven ground, irregular streets, intersecting river, and overhanging heights. The chief buildings are St. Anne Shandon's Church, with a tower 170 feet high; several Catholic churches; 4 monasteries; 2 nunneries; the Bishop's Palace; and Queen's College, a fine Tudor-Gothic quadrangular building, opened in 1849. The banks of the Lee above and below C. are richly planted, and studded with villas.

The Lee is navigable to about a mile above the city, and on the improvement of the navigation the harbor commissioners have expended above £300,000 within the last 25 years. The extent of the quays is now above 4 miles, and ships of 600 tons reach them. C. harbor, noted for its size and safety, is a basin of 10 square miles, formed by the estuary of the Lee. It could contain the whole British navy, and has been the main source of the rise and progress of the city. The estuary contains several large isles, rising abruptly and high above the water, with narrow channels between them. The entrance is by a channel two miles by one, defended by batteries, on Spike, Hawlboline, and Rocky Islands, which are occupied by convict and ordinance depots, artillery barracks, and a powder magazine. On the shores of the estuary are the towns of Passage and Queenstown, formerly Cove of Cork. C. harbor is much frequented by wind-bound ships and ships waiting orders. In 1880, 2880 vessels, with a total tonnage of 728,556 tons, entered the port; and 2,526, of 649,722 tons cleared. The chief manufactures are leather, iron, gloves, ginghams, friezes, flour, malt liquors, and whiskey; iron-shipbuilding has been largely carried on since 1872. The chief exports are grain, provisions, butter, live-stock, and linen, valued at several millions sterling yearly. Pop. (1881) 78,361; (1871) 78,642; parl. bor., 100,518; of whom about $\frac{5}{6}$ths are Roman Catholics. C. returns 2 members to parliament.—C. grew up around an abbey founded in 600 by St. Finbar. The Danes in the 9th c. built the city walls. Dermod Maccarthy, king of Cork or Desmond, surrendered it to Henry II. in 1172. Cromwell besieged and took it in 1649, and Marlborough in 1690. James II. landed at C. in 1688. In C., William Penn, the founder, of Pennsylvania, became a Quaker, with several of the soldiers of the republican garrison.

CORK, a maritime county in Munster, the south-most and largest of the Irish counties. It is bounded on the N. by Limerick, E. by Tipperary and Waterford, S. by the Atlantic, W. by Kerry. Greatest length from E. to W., 110 miles; greatest breath, 70; average 34. Area, 1,849,683 acres, of which 431,456 were under crops in 1881. C. is hilly, with great variety of surface. The W. part is rocky, mountainous, wild and boggy; the E. and S., rich, fertile, and picturesque. The ranges run E. and W., except the Boghra Mountains, between the Lee and Blackwater. The coast is bold and rocky, and from its indentations, 250 miles long, the bays which run 3 to 25 miles inland, admitting large vessels. The chief bays are Bantry, Dunmanus, Clonakilty, Kinsale, Cork Harbor, and Youghal. There are many isles off the coast, the chief being Whiddy (in Bantry Bay), Bear, Innissherkin, Great Island, and Clear, which lies in lat. 51° 25′ N. and long. 9° 30′ W., and, with the exception of a rock 4 miles to the S.S.W., is the southmost point in Ireland.

In the W., C. is divided from Kerry by a range of Silurian clay-slate, running N.E. and N., the chief points being 1200 to 2200 feet high. This range sends offshoots to the east, which divide the county into the parallel basins of the three chief rivers of C., the Blackwater, Lee, and Bandon; the lower parts of these basins are well cultivated and productive. The basins of the Lee and Bandon consist of red and yellow Devonian sandstone, with some beds of lower carboniferous limestone. This limestone, as in other parts of Ireland, forms the largest lowland tracts and valleys of the county. The Blackwater basin also consists of Devonian strata, but with more limestone. Part of the Munster coal-field occupies 400 square miles in the N.W. of the county, with a cold, stiff, moory soil over it. The river-beds generally mark the limestone tracts. C. has many small lakes in the west. One of these lies at the source of the Lee, amid wild, picturesque scenery, with the ruins of a chapel on an islet frequented by pilgrims. The chief mineral productions are coal and iron, copper, (the mines of which are the richest in Ireland), limestone, fine dark-gray and also red marble rich in fossil shells, fullers' earth, brick-clay, marl. There is a thermal magnesia spring at Mallow. The climate is moist, but genial. The soils are calcareous, loamy, and moory. The dairies are extensive, and C. butter stands in high estimation. The cattle are small in size, but yield large quantities of milk. Of the land under crops in 1881, 24,597 acres were under wheat, 101,934 acres under oats, 22,260 acres under barley, bere, and rye, 68,717 acres under potatoes, 33,787 acres under turnips, 15,842 acres under other green crops, and 164,298 acres under meadow and clover. The live-stock in the same year consisted of 54,424 horses and mules, 11,194 asses, 386,215 cattle, 264,165 sheep, 144,856 pigs, 22,857 goats, and 1,115,567 head of poultry. The chief manufactures are linen, whisky, porter; and the chief exports provisions. Pop. (1841) 854,118; (1851) 653,180; (1871) 517,076; (1881) 495,607. C. county returns eight members to parliament—two for the county, two for C. city, and one each for Bandon, Mallow, Kinsale, and Youghal. In 1880 there were 102,087 pupils attending the national schools in C., of whom 96,909 were Roman Catholic, 4413 Protestant Episcopal, and 387 Presbyterian. The antiquities of C. are stone circles and altars, two round towers, circular earthworks or raths; many ruins of abbeys and churches, chiefly built by descendants of the English invaders under Henry II., and many ancient castles or square towers of great historical interest.

CORLEO'NE, a town of Sicily, in the province of Palermo, about 21 miles from the city of that name. It is situated on a hill near the source of the Belici, and is well built. Its principal public structures are convents and churches. Its inhabitants, about 15,350 in number, are chiefly engaged in agriculture.

CORM (Gr. *kormos*, a stump)—sometimes called a *solid bulb*—the short and bulb-like subterranean stem of many endogenous plants. It annually produces buds in the form of small corms, either from its summit or its side; and these gradually exhaust and destroy it. In functions, as in appearance, the C. resembles the Bulb (q. v.), but its structure is different; it does not consist chiefly of scales, as a bulb does, but of a solid axis covered only with thin membranes. Examples may be seen in the tulip, crocus, gladiolus, colchicum, and arum. When a C. produces young corms from its summit, as in the crocus, they approach in a few years the surface of the soil, however deeply they may at first have been planted.

CORMENIN, Louis Marie de la Haye, Vicomte de, a distinguished French jurist and publicist, was born at Paris, January 6, 1788. Educated for the law, he was, in 1810, appointed auditor of the Council of State, and drew up several of its most important reports. He was elected a deputy in 1828, and from that time until 1846, continued to be re-elected at every election, sometimes by as many as four departments at once. His extensive knowledge of jurisprudence, and of the practical affairs of government, and the clear and logical force with which he could present his ideas alike by speech and writing, soon secured him an immense influence in public affairs. After the revolution of 1848, C. had the honor of being elected to the Chamber by four departments, and was nominated president of the commission appointed to remodel the constitution; and in this capacity strongly advocated universal suffrage. He was appointed member of the Council of State reconstituted after the *coup d'état*. In 1855, he was elected a member of the Institut. Besides his numerous pamphlets, C. is author of *Etudes sur les Orateurs Parlementaires*, a work which has passed through nearly twenty editions; and of a valuable work on the law of France (*Droit Administratif*). After long silence, C. published in 1860 *Le Droit de Tonnage en Algérie*. He died at Paris, 6th May 1868.

CO'RMORANT (*Phalocrocorax*; Fr. *cormorant*; Ital. *corvo marino*; Bret. *morvran*, a sea-crow; Welsh, *mor*, sea, and *bran*, a crow), a genus of web-footed birds of the family *Pelecanidæ* or *Totipalmati*, having, like the rest of that family, the hind-toe united in a single membrane with the other toes; and also characterized by a bare dilactable membrane beneath the lower mandible, extending to the upper part of the throat, but not forming a great sac on the throat, as in the pelicans; a compressed bill, rounded above, and with a strong hook at the point of the upper mandible; the nostrils linear, and seemingly impervious to air; the claw of the middle toe serrated, apparently in order that it may be used in trimming the plumage; the wings of moderate length; the tail-feathers stiff and rigid, and used to aid in walking or climbing.

The species are distributed over the coasts of most parts of the

world; some of them occasionally ascending rivers in pursuit of fish, on which all of them exclusively live, and even visiting inland lakes. They are proverbial for their excessive voracity. They do not take their prey by diving when on wing, but pursue it by swimming and diving, using their wings in progress under water, and descend to a wonderful depth; the smaller of the two British species has been caught in a crab-pot fastened 120 feet under water. When the prey has been caught in a manner inconvenient

Cormorant.

for swallowing, they toss it in the air, and adroitly catch it as it descends. Some of the species frequent high rocks, others low islands, on which they make rude nests, chiefly of sea-weed; some perch and even build their nests on mangroves and other trees. Their eggs are covered with a calcareous incrustation. The flesh of all the species is dark and of a fishy taste, but is sometimes used as food, particularly that of young birds. The British species are the Common C. (*P. carbo*), which is mostly of a black color, but for a short time during the breeding-season exhibits a sprinkling of longish white, almost bristly feathers on the head and back of the neck; and the Green C. or Shag (*P. graculus*), which is of smaller size, and of a prevailing dark-green color. The Common C. is about 23 inches long. It is a very widely distributed species. It was formerly sometimes tamed in England, to be employed in catching fish, and is still trained to this use in China.

CORN (Ger. *Korn*) meant primarily any small, round, hard body, like a seed. This general meaning is still seen in its application to concretions on the feet. It is allied to the Lat. *granum*, grain; and to Ger. *Kern*, kernel. As usually applied, C. is a generic name for all seeds used in making bread, especially the seeds of cerealia. But it has also a specific sense, and denotes in any country that grain which furnishes the prevalent bread-stuff of the people. Thus, in England, C. means *wheat;* in America, it means *maize;* and in Scotland, *oats*.

CORN LAWS, the name popularly given to certain statutory enactments which had for their object a restriction of the trade in grain. The English C. L. date as far back as the year 1360, in the reign of Edward III. Before this period, there seems to have been a general rule carried into effect by the crown against the exportation of any grain; and the act of 1360 enacts the prohibition, but at the same time excepts Calais and Gascoigne, with any other places which the king may appoint by license, from its operation. In 1393, the arrangement was reversed, and the right to export was made general, unless to those places to which it was prohibited by royal proclamation. An act of 1436 permitted exportation when the price of wheat did not exceed 6*s*. 8*d*. per quarter. Hitherto, there seems to have been no prohibitions against importation; but in 1463, an act was passed prohibiting it so long as the price at home was below the 6*s*. 8*d*. at which there was free exportation.

The next change was in the reign of Henry VIII., when an act of 1534 prohibited all exportation except by license specially granted under the great seal. This act was not found to work well; and twenty years later, the previous arrangement was adopted of allowing exportation when the price had reached a certain point. The subsequent legislation for some time merely changed the price at which exportation might begin, generally enlarging it. After the Restoration, the policy of increasing the duties on importation, for the protection of agriculture and the landed interest at home, begins to be perceptible. At the same time, the effect of that event on the condition of Scotland and England towards each other forms a curious illustration of such fiscal regulations. Under the Protectorate, they were one country, with free intercommunion of trading privileges. Scotland was increasing in wealth under this arrangement; but the countries were separated by the restoration of Charles II., and became the same to each other as foreign nations. The English duties restricted the importation of grain from Scotland; and in 1663, the Scotch parliament, in retaliation, laid heavy duties on the importation of English and all other foreign grain. Had not the union of 1707 made the countries one again, England and Scotland would probably have continued a corn-law contest against each other, like the French provinces.

The agricultural interest continuing powerfully to modify this department of legislation, an act was passed in 1670, for virtually prohibiting the importation until home-price had reached 53*s*. 4*d*., and laying a heavy duty on it above that point. This law had, however, little effect in favor of the landed interest, from the circumstance that then, and for long afterwards, Britain was an exporting, not an importing country—that is to say, it generally produced more corn than its population required. A new device was adopted at the Revolution, and a bounty was awarded on exportation—that is, a sum was paid to the producer for what he exported, so that if the price in the foreign market might not induce him to send corn abroad, the bounty, in addition to that price, might. For upwards of a century, the numerous enactments in this department will be found to be a mere shifting, according to circumstances, of the incidence of the bounty on the one hand, and of the import duty on the other. In 1773, a permanent adjustment was supposed to be reached by Burke's act, which removed the bounty, and prohibited exportation when the price reached 44*s*., and allowed importation at a nominal duty of 6*d*., at a price of 48*s*. Afterwards, and especially during the great war of the French Revolution, it became usual to profess that the chief object of this kind of legislation was to have always a sufficient supply of grain at home for our own wants, and to render us entirely independent of foreign nations for the food of the people.

It was maintained that the bounty effected this object, since its tendency was to promote the production of more grain than was necessary at home, and it thus supplied a granary to be drawn upon in case of famine. It was otherwise, however, maintained, that the prohibiting, or, at all events, restraining the introduction of foreign grain, would give a much greater impulse to home production. Looking at it from the agricultural interest solely, this view was well founded; for, as the tendency of Britain to be an importing rather than an exporting country was increasing, the exportation, even with the encouragement of the bounty, was likely to be small. It could not, however, escape consideration, that to increase home production by a pressure on importation, was virtually to aggrandize the landed interest by a pressure on the food of the people. With these views, the price at which importation might begin was raised in 1804, and was again raised in 1814, when the bounty was abandoned as worthless for its purposes. There had been a tendency to what is called 'a sliding scale' in the duties on importation. This arrangement was brought into systematic shape by the act of 1814, and subsequently, by the celebrated act of 1828, it reached what was considered by its supporters a state of perfection.

Throughout these various changes there were not wanting writers and speakers who denounced the C. L., and agitated for their removal. But the public at large, though conscious that the laws were some way improper, or at variance with the principles of political economy, did not till the very last, earnestly unite in calling for repeal. There was a powerful party who defended the C. L., and represented with wonderful plausibility, that these restrictive statues were identified with the best interests of the country. Their arguments might thus be summed up: 1. Protection was necessary, in order to keep certain poor lands in cultivation. 2. It was desirable to cultivate as much land as possible, in order to improve the country. 3. If improvement by that means were to cease, we should be dependent on foreigners for a large portion of the food of the people. 4. Such dependence would be fraught with immense danger; in the event of war, supplies might be stopped, or our ports might be blockaded, the result being famine, disease, and civil war. 5. The advantage gained by protection enabled the landed proprietors and their tenants to encourage manufactures and trade; so much so, that if the C. L., were abolished, half the country shopkeepers would be ruined; that would be followed by the stoppage of many of the mills and factories; large numbers of the working-classes would be thrown idle; disturbances would ensue; capital would be withdrawn; and no one would venture to say what would be the final consequences. It cannot be uninstructive to put on record that these arguments exercised a commanding influence over the laboring-classes, the small-town shopkeepers, almost all the members of the learned professions, and a considerable section of both Houses of parliament.

Ignorance, prejudice, and timidity were united with selfishness in maintaining the C. L.; and in point of fact, those who endeavored to represent the impolicy of a restricted trade in corn, were generally set down as little better than mischief-makers. The most surprising thing of all was, that the statesmen who ultimately joined in condemning the C. L., could contemplate no other modification than an ascending and descending scale of duties, according as prices fell or rose in the market. About 1840, there was no term better known than that of the *sliding scale*. The ob-

ject of this device was to reduce the import duty as the price of grain increased, for the purpose of virtually prohibiting the importation when the price was low, and encouraging it when the price was high, so that at famine-prices grain might come in duty free. By the act of 1828, the price of 62*s.* a quarter on wheat was taken as the turning-point. At that price, the import duty was £1, 4*s.* 8*d.* For every shilling less in the price, a shilling was added to the duty. When the price rose above this point, a different gradation ruled, the duty decreasing by a larger ratio than the rise. Thus, when the price was 69*s.*, the duty was 15*s.* 8*d.*; and when it rose to 73*s.*, the duty sunk to its minimum of 1*s.* The effect of this fluctuation in rendering the trade a gambling one was, one would think, obvious, and yet it was not acknowledged until it had been proved by a series of ruinous instances. Thus, an importer who, when the price of grain was 73*s.* a quarter, bought a cargo, if the price sunk 4*s.* before he could accomplish a sale, had not only to sell at that reduced price, but with a further reduction of 14*s.* 8*d.* a quarter paid as duty. What was still more important, the supplies to this country being so capricious and irregular, foreign countries did not grow corn habitually for the British market. In 1843, Sir Robert Peel tried a modification of the sliding scale, which did not in the least degree mitigate the hostility to the C. L., the noxious nature of which was now beginning to be better understood. Roused by the addresses of Mr. Cobden, Mr. Bright, and other leaders of the ANTI-CORN-LAW LEAGUE (q. v.), the people poured in petitions to parliament; and at length, Sir Robert Peel, yielding to representations on the subject, and now avowedly a convert to FREE-TRADE (q. v.), carried a measure to put an end to the C. L. in 1846.

The results of the repeal are well known. Every evil prognostication has been falsified. The liberation of the trade in corn has not, however, lowered the price of bread to the extent that some persons anticipated. This is accounted for as follows: an increased demand in consequence of the population increasing in numbers, and also improving in means and taste; and the cost of freight and other charges virtually protect the home-grower to the extent of several shillings a quarter. The small registration duty of one shilling a quarter, maintained till 1869, was abolished in that year; since which time the importation of corn is absolutely free.

TOTAL AMOUNT OF WHEAT AND FLOUR, AND OTHER GRAIN AND MEAL IMPORTED IN 1844, 1849, 1854, AND 1859, DISTINGUISHING THE COUNTRIES WHENCE RECEIVED.

Total,	3,030,681	10,669,661	7,909,544	10,270,774

The substantial benefits arising from the repeal of the C. L. consist in the stimulus given to trade, the removal of apprehensions as to the effects of insufficient harvests, along with a certain modification and less fluctuation in price. The following tables will convey the best illustration of the effect of repeal of the corn laws:

Average Periods of Ten Years.	Average Amount of Wheat Imported.	Average Price of Wheat during each Period.	Average Total declared Value of all British Exports.
	Bushels.	*s.* *d.*	£.
1801 to 1810	600,946	81 5	40,737,970
1811 " 1820	458,578	84 11	41,506,794
1821 " 1830	534,992	58 3	36,600,536
1831 " 1840	907,638	56 10	45,249,037
1841 " 1850	2,877,999	53 3	57,412,494
1851 " 1859	4,547,311	54 9	103,253,189

Between the period 1801—1810 and 1841—1850, we find an increase in the value of British and Irish exports of £16,674,524. The value of the British imports of corn, grain, and meal, in 1877, was £63,536,322; in 1880, it was £62,857,269. Formerly Russia and France were the sources whence Great Britain was mainly supplied with its foreign stores of grain. But in recent years the imports of bread-stuffs (especially wheat) from the United States have enormously increased, so that now our chief supplies come thence; and the rivalry of the American grain-grower has become more and more formidable to the British farmer. In 1880, the imports of grain and flour from the United States amounted to 75,526,972 cwts., of the value of £35,596,192. The new wheat-growing districts of Canada also send us large quantities.

CORN AP'HIS, or WHEAT A'PHIS (*Aphis granaria*), a species of *Aphis* (q. v.), or Plant Louse, which is sometimes in-

Corn Aphis:—*a*, natural size.

jurious to corn-crops, appearing in great numbers on the ears, sucking the juices of the plant, and so impoverishing the grain. It infests wheat, barley, and oats. The male is green, the female dull orange.

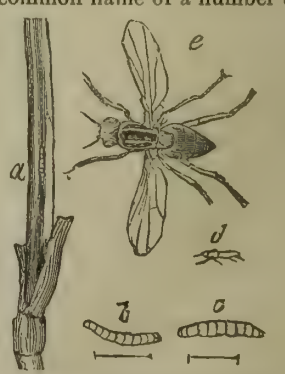
CORN BEE'TLE (*Crucujus testaceus*), a minute beetle, which inhabits granaries and mills, and of which the larva often does

Corn Beetle:
a, larva, natural size; *b*, larva, magnified; *c*, perfect insect, natural size; *d*, perfect insect, magnified.

much mischief, feeding, like the weevils, on grain, particularly on wheat. The perfect insect is of a bright fulvous color; the larva ochreous, with a forked tail.

CORN CRAKE. See CRAKE.

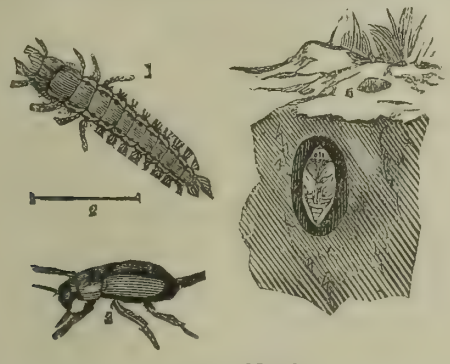
CORN FLY, the common name of a number of small dipterous



Corn Fly (*Chlorops tæniopus*);—*a*, a portion of a culm or stem of wheat with swollen joint, caused by larva of corn fly; *b*, larva; *c*, pupa; *d*, fly natural size; *e*, fly, magnified.

(two-winged) insects, of the large family *Muscides*, particularly of the genera *Chlorops* and *Oscinis*, which do great injury to corn crops. The most destructive in Britain is *Chlorops tæniopus*, a fly about a line and a half in length, of a pale-yellow color, with black stripes, which deposits its eggs between the leaves of young plants of wheat or barley. The maggots living on the juices of the plant produce the disease which, from the swelling of the joint, is called *gout;* and the plant, impoverished, either produces no ear, or an imperfect and partially shriveled one.

CORN GROUND BEETLE (*Zabrus gibbus*), an insect of the order *Coleoptera*, section *Pentamera*. It is about six lines in length, of a shining pitchy black color, with rusty jaws and legs, very broad and convex, the wings large, the antennæ short and slender. It burrows in the ground, climbs the stalks of wheat and



Corn Ground Beetle:
1, larva, magnified: 2, natural size of larva; 3, perfect insect, female, slightly magnified; 4, a cell containing pupa: 5, a burrow.

barley by night, and devours the ears. The larva is of a remarkable appearance, whitish, with brown head and thorax, and a brown stripe down the body, powerful jaws, six thoracic legs, and little tufts of hair along the sides of its elongated tapering abdomen. It burrows in the earth, and eats the stems of corn close to the surface of the ground.

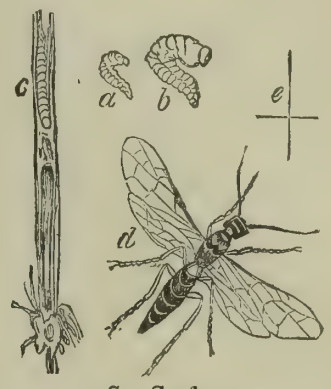
CORN SA'LAD, or LAMB'S LE'TTUCE (*Fedia* or *Valerianella*), a genus of plants belonging to the natural order *Valerianaceæ*, having a toothed calyx and 5-fid corolla, three stamens, and a 3-locular fruit, crowned with the calyx. The species are annual plants of humble growth, with repeatedly forked stems, and very small flowers, growing in cultivated grounds, &c. Several species, very closely resembling each other, are natives of Britain, and others are found on the continent of Europe. Some of them are frequently used as spring salads, and sometimes as a substitute for spinage, particularly the common C. S. (*F.* or *V. olitoria*), the most abundant species in Britain, the *Mâche* of the French, *Rapunzcher* of the Germans. It is a favorite salad in France and Germany, although it is mucilaginous, and wants pungency. The lower leaves are somewhat spoon-shaped, the upper leaves oblong. The plant is extremely easy of cultivation, and can be obtained in the very first days of spring, when vegetables are scarce. The VINEYARD SALAD of the Germans (*F.* or *V. carinata*), and ITALIAN C. S. (*F.* or *V. eriocarpa*), are sometimes preferred for their larger leaves and finer flavor.

Corn Salad:
b, a flower.

CORN MOTH (*Tinea granella*), a small species of moth of the same genus with the Clothes' Moths (q. v.). This moth is satiny and of a cream-white color; the superior wings marbled with gray, brown and black, and when at rest sloping like the roof of a house, their fringe turned up behind like a tail. It abounds in spring and summer, and lays its eggs either among stored grain or in sheaves in the field. The eggs are so small as to be invisible to the naked eye. The larva, or CORN WORM—which, for its voraciousness, is known as *the wolf*—eats into the grain, and attaches grains together by a web. It attacks indifferently any kind of grain; sometimes also books, articles of pasteboard, woollen stuffs, and even wood. Frequent turning of heaps of corn is resorted to for the destruction of the eggs and larvæ, and salt is for the same purpose mixed with corn; the floors, walls, ceilings, beams, &c., of granaries are scrubbed with hot water and soap, or washed with lime and water, sprinkled with vinegar, &c.; and lamps are employed to attract and kill the moths.—Another very troublesome moth, also called C. M., is *Butalis cerealella*, which is not yet known in Britain, but is found in some parts of Europe and America.

CORN RENT. See RENT, LEASE.

CORN SAW'FLY (*Cephus pygmaeus*), a species of Sawfly (q. v.) which sometimes does much mischief in cornfields, particularly to wheat or rye; the female, by means of her ovipositor, laying her eggs in the stems either below the first joint or just under the ear;

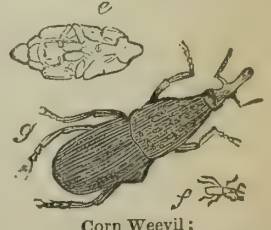


Corn Sawfly:
a, maggot, natural size; *b*, maggot, magnified: *c*, the maggot in its ear in the stem of the corn; *d*, female insect, magnified; *e*, female insect, natural size.

the larva consuming the inside of the stalk, sometimes perforating the joints, and at last cutting it through near the ground, and undergoing its transformation into the pupa state in the stump which remains. The C. S. is almost half an inch long, of a very slender form, shining black with some yellow markings; the larva is fat, tapering, wrinkled and yellow. The fly is often to be seen on the flowers of umbelliferous plants.

CORN THRIPS (*Thrips cerealium*), a minute insect, not quite a line long, often abundant on flowers, and which does much mischief to grain crops, particularly late-sown wheat, insinuating itself between the chaff and the immature grain, which it causes to shrivel; also at an earlier period causing the abortion of the ear, by puncturing the stalks above the joints and sucking the juice. The C. T. is of a shining pitchy black, the body long, the male wingless, the female having four narrow wings, which are fringed with long hairs; the larva is yellow, as is also the pupa, which is active. See THRIPS.

CORN WEE'VIL (*Calandra granaria*), a coleopterous insect of the family *Curculionidæ*, which although a small creature, not quite two lines long, is often extremely destructive to grain stored in granaries. It is much more common in the southern than in the northern parts of Europe. The perfect insect is of a dark chestnut or reddish pitchy color, with short oval wing-cases, but without wings, the thorax much marked with depressed dots, the head elongated into a proboscis, the antennæ bent at right angles. The female makes a little hole in a grain of corn, and deposits an egg in it, the larva feeds on the farina; and as a single female lays many eggs, and perfect insects are soon produced from them, the mischief, unless counteracted, extends very rapidly. To arrest it, however, has always been found extremely difficult; and the most successful method is said to be that of making a little separate heap of grain, which, being left unstirred, whilst the greater heap is stirred very frequently, soon becomes the refuge of the weevils, particularly if it is a heap of barley, of which they are fondest, although they will eat any grain, and there they are killed by boiling water.—Of the same genus are the Rice Weevil (*Calandra Oryzæ*), and a large South American insect (*C. palmarum*), an inch and a half long, the grub of which lives in the stems of



Corn Weevil:
e, pupa, magnified; *f*, insect, natural size; *g*, insect, magnified.

palms, and is eaten as a delicacy both by Indians and Creoles. For the above illustrations of corn insects we are indebted to Morton's excellent *Encyclopædia of Agriculture*. Blackie, London and Glasgow.

CORNA'CEÆ, a small natural order of exogenous plants, containing about 40 known species, chiefly trees and shrubs, with a few herbaceous plants. The leaves are simple, without stipules; the flowers in heads, umbels, or corymbs. The calyx is 4-lobed or 4-toothed; the petals 4, equal, oblong, broad at the base, inserted into the upper part of the tube of the calyx; the stamens 4, alternate with the petals; the ovary is adherent to the tube of the calyx, 2—3-celled, crowned by a disk; the ovules solitary; the style filiform; the stigma simple; the fruit is fleshy and drupe-like. The C. are natives of the temperate parts of the northern hemisphere. The fruits of some are eatable; the bark and leaves of some are medicinal; some are valued as ornamental plants. CORNEL, DOGWOOD, AUCUBA, and BENTHAMIA are examples.

CORNA'RO, LODOVICO, a Venetian nobleman, born 1467, is remembered on account of his instructive example of temperance. His constitution, naturally not strong, was greatly injured by intemperate eating and drinking, with other excesses, so that, when forty years of age, he appeared to have little hope of prolonged life. At this time he adopted strict rules of temperance both in meat and drink, which, co-operating with his general care of health and gentle exercises of various kinds, served to extend his life to nearly 100 years, as he died, according to the best authorities, in 1566. His old age was remarkably cheerful. To promote those habits which had proved so advantageous in his own case, he wrote, in his 83d year, his celebrated treatise *Discorsi della Vita Sobria* ('Essay on Temperate Living'), which was first published at Padua in 1558, and has been translated into all European languages. The best English translation is one bearing date 1779.

CO'RNBRASH, a member of the Lower Oolite, consists chiefly of a rubbly cream-colored lime-stone in thin layers, always nodular and concretionary, each fragment having a deep-red coating. Occasional beds of clay occur interstratified with the limestone. The whole thickness of the group rarely exceeds 15 feet. The C. is extremely rich in Echinodermata and Mollusca, with the exception of Cephalopoda, the abundant Oolite genus Belemnites being unaccountably wanting.

CO'RNËA, one of the coats of the eye; so called from its resemblance to horn (Lat. *cornu*). See EYE.

CORNEILLE, PIERRE, the creator of French tragedy, was born June 6, 1606, at Rouen, where his father was an advocate. He himself studied for the legal profession. A love adventure, in which he became the rival of a friend, first prompted C. to write verses, and *Mélite*, the comedy founded on this incident, was performed with success in 1629. It was quickly followed by other dramatic pieces: *Clitandre*, *La Veuve*, *La Galerie du Palais*, *La Suivante*, and *La Place Royale*—all so successful that a special theatrical company was formed for the performance of C.'s pieces. In 1635 appeared his *Médée*, a declamatory drama, written in imitation of Seneca. Cardinal Richelieu, who aspired to be the Mæcenas of the stage, kept in his pay a number of writers for whom he dictated plots, and wished to number C. among his retainers; but C. was so audacious as to alter the plan of a comedy, and thus lost the cardinal's favor. He now returned to his native place, where M. Chalon, once secretary to Maria de' Medici, suggested that he should turn his attention to tragedy. As the English drama was not known, or at least not relished at that time beyond the limits of England, C. acquired the Spanish language that he might be enabled to study the Spanish drama, the only other of any consequence in Europe. The result was the *Cid* (1636), which was received with enthusiastic applause. Cardinal Richelieu alone seemed to find no merit in this drama, and induced the Academy to publish a critique in some respects unfavorable.

In his next celebrated piece, *Horace* (1639), C. endeavored to vindicate his claim to creative genius, which had been questioned by his enemies; but *Cinna* (1639) has been regarded by some French critics as C.'s master-piece, though others might be disposed to award this honor to *Polyeucte* (1640). In the *Mort de Pompée* (1641), though there is something dignified in the style, it occasionally passes into bombast. The comedy of *Le Menteur* (1642), partly taken from Pedro de Roxas, has natural truth and humor. C. now seems to have exhausted his resources, and his later pieces are almost all forgotten. Of his thirty-three dramas, only a few have kept their place on the French stage. Nevertheless, his countrymen call him *Le grand Corneille*, although Voltaire, who edited an edition of his works, and Laharpe have expressed themselves in some respects unfavorably regarding his genius. The faults of conception in several of his pieces were pointed out by the sharp criticism of Lessing. A. W. Schlegel also spoke in such a way as to provoke hot replies from the wounded pride of the French littérateurs. C.'s chief merit lies in his dignity of style, and in a certain declamatory grandeur of sentiment, which his countrymen have been accustomed to consider truly epical, and which it is now impossible to convince them as nearly resembles rant as it does sublimity. C. died October 1, 1684. The best edition of his complete works was edited by Renouard (12 vols., 1817).—C.'s brother, THOMAS (born 1625—died 1709), also acquired a reputation as a dramatic writer.

Cornel:
a, a branch with leaves and fruit; *b*, a single flower.

CO'RNEL, or CORNE'LIAN CHERRY (*Cornus mas*), the *Cornus* of the ancients, a tree or shrub of 15—20 feet high, of the natural order *Cornaceæ*, a native of the middle and south of Europe, and of great part of Asia. It is not found wild in Britain, although it is common in shrubberies, and was formerly much cultivated as a fruit-tree, as it still is in Germany and other parts of Europe. It has oval leaves, and small yellow heads of flowers, which appear before the leaves in spring, and which abound in honey and are much frequented by bees. The fruit is oblong, a little larger than a sloe, shining, red, or rarely yellow or white.

It is late in ripening, and until quite ripe is very austere; but when perfectly mellow, has an agreeable vinous acid taste: it is either eaten as it comes from the tree, or is made into a preserve, which is said to be tonic, and useful in diarrhœa. When gathered unripe, it is pickled like olives. It was formerly also fermented for a beverage. In Turkey, it is still much used in making sherbet. The wood of the C. is extremely hard and tough, and well adapted for those purposes of joiners and turners to which the size of the tree will admit of its application. It is used for making mathematical instruments.—DWARF C. (*C. Suecica*), a native of mountain-pastures and bogs throughout the north of Europe and in Britain, is a plant about six inches high, with creeping root, sessile ovate leaves, each stem producing a single umbel of a few purple flowers, followed by small sweetish red fruit, which is tonic, and has the power of remarkably increasing the appetite, whence the plant has received a Gaelic name, signifying *Plant of Gluttony*.—Dogwood (q. v.) belongs to the same genus.

CORNELL UNIVERSITY, named from its founder, Ezra Cornell (1807—1874), possesses numerous well-appointed buildings, and more than 200 acres of university grounds. It is pleasantly situated on the outskirts of the town of Ithaca, New York, and was opened in 1868, on a thoroughly unsectarian basis. By its charter, no student can be admitted or excluded on account of any religious opinions. Students unable to defray the expense of their curriculum are required to provide for their support by manual labor on the farm or in the factory attached, for which they receive the current rate of wages. They also receive an allotment of 300 acres, the produce of which helps to supply the university table. Sage College is a boarding hall for female students, with a chapel attached for religious services. According to its charter, C. U. is included within the educational system of the State, and is visited by the regents of the New York University. Having, under an Act of Congress, been endowed with 989,000 acres in the west, C. U. is bound to comprise within its range of studies 'such branches as are related to agriculture and the mechanic arts,' and to educate, free of all fees, one student from each of the 128 assembly districts of the State; the students to be chosen by competition from the public schools and academies of New York. In 1880, there were over 50 professors and instructors, and near 450 students. Women are admitted on the same terms as the men, except that they must be seventeen years of age on entering.

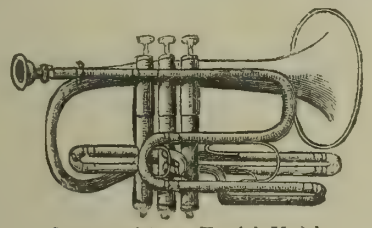
Besides three general courses, of four years each, in arts, literature, and science, the university gives special instruction and special degrees in agriculture, architecture, chemistry and physics, civil engineering, history and political science, ancient, European, and Asiatic languages, mathematics, mechanic arts, military science and tactics, natural history, philosophy, and letters.

CORNE'LIUS, PETER VON, one of the first masters of the modern German school of painting, was born at Düsseldorf, 23d September 1787, and studied under Langer in the academy of his native town. When only 19 years of age he painted some remarkable frescoes for the cupola of the old church of Neuss. Four years later, he gave still more unmistakable proofs of a cre-

ative fancy in his illustrations of Goethe's *Faust*, and the *Nibelungen Lied*. In 1811 he went to Rome. This journey exercised a profound influence on the whole of his future career. The great importance of the early masters became ever clearer to him as he studied their choicest productions. He gained a wide reputation, while at Rome, by two cartoons, 'Joseph's Interpretation of the Dream,' and Joseph's 'Recognition of his Brethren.' In 1819 he was called to Munich, and entered the service of the then crown-prince of Bavaria. Here he remained till 1841, and executed those grand works on which his fame mainly rests, and which may be divided into two classes, Pagan and Christian, the former of which comprises the large frescoes in the saloon of the Glyptothek, all illustrating stories of the Greek gods and heroes, as also representations of several Hesiodic myths, and of the various incidents of the Trojan war; while the latter, or Christian series, begun after the completion of the former in 1830, consists of frescoes on New Testament scenes, extending from the 'Incarnation' to the 'Judgment,' and decorate the 'Ludwig's Church' in Munich, which was built for the purpose of affording scope for the genius of Cornelius. The 'Judgment' is the largest fresco in the world, larger even than Michael Angelo's 'Judgment' in the Sixtine Gallery. In 1841, C. was invited by the king of Prussia to Berlin, where he was appointed director of the Berlin Academy. Among his productions in the Prussian capital are the frescoes for the Campo-Santo, or royal burial-place. Opinion is divided regarding the merits of Cornelius. By his own countrymen he is extremely admired; French critics, on the other hand, regard him as more a thinker than an artist, sacrificing to his conception both truth of color and expression. He is admitted to have been a profoundly creative genius, but *not* a painter. He formed, however, a numerous school, from which have gone forth many illustrious pupils; but he lived to see it losing hold on public sympathy. He died in the 80th year of his age, 6th March 1867.

CORNELIUS NEPOS. See NEPOS.

CO'RNET, a stop, or series of pipes, in an organ, intended to imitate the tone of an obsolete wind-instrument which has been superseded by the oboe.—The CORNET-A-PISTON, a modern



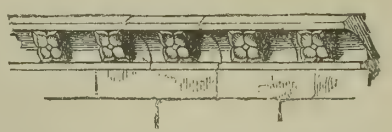
Cornet-a-piston.—Kœnig's Model.

wind-instrument of the trumpet kind, is generally made of brass, has two or three valves, and in brass bands takes the soprano and contralto parts. It was first introduced in France as an orchestral instrument. Its tones are less powerful, but far more easily manageable than those of the trumpet.

CORNET (Ital. *cornetta*, a small flag) was, until 1871, the lowest grade of commissioned-officer in the cavalry, equivalent to *ensign* in the infantry, his duty being to bear the standard. With the lieutenant, he assisted the captain in the daily duties connected with the troop to which he belonged. There were as many cornets in a cavalry regiment as there are troops. A C.'s commission used, in the days of 'purchase,' to cost £450; but much larger sums were habitually paid, varying according to the celebrity, or rather the fashionable character of the corps. The pay was 8*s*. per day, with 1*s*. or 1*s*. 6*d*. extra for field allowance. The half-pay varied from 2*s*. 6*d*. to 3*s*. 6*d*. The pay being utterly inconsistent with the price paid for the commission, none but wealthy men could enter the cavalry. In 1871, the rank was abolished, sub-lieutenants (who are merely probationary lieutenants) being substituted.

CORNE'TO, a town of Central Italy, about 12 miles north of Civita Vecchia, occupying a commanding eminence on the left bank of the Marta, and two or three miles from the Mediterranean, over which it has an extensive view. C. rose out of the ruins of the Etruscan city of *Tarquinii*, and is enriched by some of its monuments. It was erected into a city by Eugenius IV. in 1432; but the picturesque old battlemented walls and towers which surround it are said to belong to an earlier period. During the faction-wars of the Guelphs and Ghibellines, this city maintained a firm allegiance to the popes. Pop. 5000. The remains of Tarquinii (perhaps the most interesting in existence to the student of Etruscan history, as it is from the tombs here that most of our knowledge as to the games, costumes, and religious customs of this remarkable people has been derived) lie about a mile and a half from Corneto. The Necropolis of Tarquinii covered 16 square miles, and it has been estimated on high authority that it could not have contained less than 2,000,000 tombs. Of this vast number, some 2000 have been opened within recent years. Among the most noteworthy of these are the Grotta delle Iscrizioni, the Grotta delle Bighe, Grotta del Barone, Grotta Francesca, Grotta del Cardinale, Grotta del Triclinio, and Grotta della Querciola. Treasures from this mine of Etruscan wealth, as it may be called, enrich the British Museum, and other important collections in Britain and on the continent.

CO'RNICE. In classical architecture, the C. is the uppermost member of the entablature, surmounting the frieze. Each of the orders has its peculiar C.; but these, with their relation to the other portions of the entablature, will be better understood when



Cornice;—Ensham Church, Oxon, circa 1450.

explained in conjunction with that term. See ENTABLATURE. In the Gothic styles, the form of the C. varies greatly. 'In the Norman style,' says Parker, 'a plain face of parapet, slightly projecting from the wall, is frequently used as a C., and a row of blocks is often placed under it, sometimes plain, sometimes moulded or carved into heads and other ornaments, when it is called a corbel table.' These blocks have commonly a range of small arches over them. In some cases a small plain string is used as a cornice. The corbel table continued to be used as a C. in the

Corbel Table.

Early English style; but it was generally more ornamented than in the Norman, the arches being commonly trefoils and well moulded. The blocks are frequently ornamented with a head, or other figure characteristic of the style. Sometimes a range of horizontal mouldings is placed above the arches of the corbel table, and sometimes the C. consists of simple mouldings, without any corbel table.

The term C. is also used, in a general sense, to signify any horizontal moulded projection, terminating a building, or the component parts of a building. It is in this sense that we speak of the C. of a room.

CORNICHE. See RIVIERA.

CO'RNO, MONTÉ, or GRAN SA'SSO D'ITA'LIA, a mountain in Southern Italy, the culminating peak of the Appenines, in lat. 42° 27′ N., long. 13° 38′ E. It has an elevation of 9591 feet; and its summit is covered with snow at all seasons.

CORNS are small hard growths, resulting from an increase in the thickness of the cuticle or epidermis, which is generally caused by the irritation of some excessive pressure or friction on the part.

They occur most commonly on the toes as a result of tight shoes. Three varieties of C. are described, viz.—1. *Laminated Corns* or *Callosities*, in which the hardened cuticle is arranged in layers, frequently of a dark-brown color, from the effusion of blood in the deeper layers. 2. *Fibrous Corns* (clavi), which are not only fibrous in their early stages, but, as time goes on, sink into the skin, sometimes producing great pain. Frequently, a bursa, or small bag, is formed beneath, to protect the tender subjacent tissues, and if this bursa should inflame, matter speedily forms, and the pain and constitutional irritation become severe; at other times, the pressure may cause absorption of the ends of bones, and serious alterations in the condition of a joint. The duty of the chiropodist is to dislodge the imbedded peg of hard cuticle from its socket. Should he cut it across, the fibrous arrangement will present the appearance of 'roots,' a popular delusion of great value to itinerant corn-doctors. 3. *Soft C.* occur between the toes, and cause much annoyance; they are generally small, and being constantly bathed in perspiration, the cuticle does not harden, as in the other varieties. They sometimes give rise to painful ulcerations.

The treatment of C. consists in the removal of all undue pressure or friction, either by removing the shoe altogether, or protecting the corn by surrounding it with a border of some soft material, as Amadou, (q. v.) or soft leather; or the hardened cuticle may be softened by the application of some alkaline lotion, and then scraped or filed away: or it may be extracted, as before mentioned. A lotion of soda or potash is often found very useful.

The cuticle composing a soft corn should be clipped off with scissors, and a small piece of cotton-wool be placed between the toes. In all serious cases, application should be made to a respectable chiropodist.

C. affect horses as well as men. In the foot of the horse they occur in the angle between the bars and outer crust, and consist in a bruise of the sensitive secreting sole. Two forms of feet are especially subject to them—those with deep narrow slanting heels in which the sensitive sole becomes squeezed between the doubled up crust and the shoe; and wide flat feet which, by the senseless cutting away of the bars and outer crust, allow the delicate interior parts to be pressed with all the force of the animal's weight on the unyielding iron shoe. Scrum and blood are poured out, whilst the secreting parts being weak and irritable, produce a soft, scaly, unhealthy horn. C. constitute unsoundness; cause a short, careful, tripping gait; are the most frequent source of lameness amongst roadsters; abound in badly-shod horses, especially those with the kind of feet alluded to; and usually occur in the inside heels of the forefeet, these being more especially subjected to weight, and hence to pressure.

The discolored spot indicating the recent corn must be carefully cut into with a fine drawing-knife; any serum or blood is thus allowed free vent. If the bruise has been extensive, a poultice will have the twofold effect of allaying irritation, and relieving the sensitive parts by softening the hard unyielding horn. When the injury has been of some standing, and some soft faulty horn is secreted, a drop of diluted nitric acid may be applied. On no account must the bars or outer crust be removed; they are required for bearing weight, which may be further kept off the injured parts by the use of a bar-shoe. In horses subject to C., keep the feet soft by dressing with tar and oil or any suitable emollient; pare out the C. every fortnight; use a shoe with a wide web on the inside quarter, and nailed only on the outside; and, if the sole is thin and weak, employ leather pads.

CO'RNSTONE, a peculiar—often mottled—limestone of the Old Red Sandstone formation of Herefordshire, Shropshire, and South Wales.

CO'RNU AMMO'NIS. See AMMONITES.

CORNUCO'PIA (Lat. *cornu*, a horn, and *copia*, plenty). The horn of plenty—regarding the origin of which several fables are told by the ancient poets—is generally placed in the hands of emblematical figures of Plenty, Liberty, &c., who are represented as pouring from it an abundance of fruits, corn, &c. It is frequently used both in architecture and heraldry. On the arms of banks and other public institutions, it is often represented pouring forth coins.

CO'RNWALL, a maritime county, forming the south-west extremity of England, and the southmost county in the British Isles. It is a peninsular right-angled strip of land, with the apex in the south-west, and is bounded on the E. by Devonshire, with the Tamar between, on the N. and W. by the Atlantic, and on the S. by the English Channel. From its Devonshire boundary it runs south-west, narrowing to the Land's End, the westmost part of England in 5° 41′ 31″ W., it then bends north to Penzance, whence it sweeps round in a south-eastern direction to the Lizard Point, the southmost part of England, in 49° 57′ 30″ S. From thence it follows a north-eastern course to Plymouth Sound. Greatest length in a straight line from Welcomb to the Land's End, 81 miles; extreme breadth from Welcomb to Rame Head, 46 miles. Area, 1365 sq. miles, of which seven-eighths are arable, meadow, or pasture. The surface is irregular, with rapid ascents and descents. A ridge of rugged, bleak, moory hills, rising to the height of from 800 to 1300 feet, run south-west through the center of Cornwall. From this ridge the country slopes, and the streams flow on each side.

The hill valleys are longer and wider on the south than on the north side of this ridge, and some of them are picturesque with corn, wood, orchards, rivulets, and meadows. The coasts are bold and rocky, and indented with many headlands and bays. The chief indentations are Plymouth Harbor, Falmouth Harbor, one of the finest in Britain, and Mount's Bay between Lizard Point and Land's End. Twenty-four miles off the latter point are the Scilly Isles. On the north-west coast occur shifting sands, often in hills several hundred feet high. The chief rivers are the Tamar, which runs 59 miles along the east border, 19 miles being a tidal estuary, ending in the noble roadstead of Plymouth Sound; the Fal, which runs 20 miles south, 10 miles being tidal, and ends in the fine harbor of Carrick Road, near Falmouth; and the Allan or Camel, 29 miles long, 8 being navigable. Woods, meadows, arable land, and 140 parish churches, are said to have been submerged between Mount's Bay and the Scilly Isles. Old red sandstone, the 'killas' of the miner, covers above three-fourths of C., and is intersected by three large masses of granite in the interior of the county, with one around Land's End, and by porphyry veins and dikes, some being 50 or 80 fathoms thick, and also by limestone beds. The granite on the hills is often worn by the weather into the form of prismatic, cubical, or spheroidal blocks, piled in gigantic cairns. These blocks sometimes form Logging or Logan Stones. Copper and tin veins, generally 1 to 3 feet thick, but varying from the thickness of paper to 30 feet, and of unknown depth, run through the granite and sandstone, generally from east to west. Tin also occurs in the gravel; and lead, silver, cobalt, and antimony veins in the sandstone. Lizard Point consists of mica-slate, with soapstone veins, and chinastone; and the country around, of serpentine, hornblende, and diallage rocks. Chinastone, or decomposed felspar of granite, is found near Launceston, and is a chief ingredient in retorts and crucibles made in Staffordshire. In 1880, C. had 38 copper mines, 5 lead mines, and 73 tin mines, producing 2004 tons of copper, 570 tons of lead, and about 12,000 tons of black tin. Of iron ore, 15,865 tons were produced. C. yields $\frac{1}{3}$ of the copper and $\frac{9}{10}$ths of the tin raised in the British Isles. The great mining district extends from Dartmoor, in Devon, to Land's End, the veins and lodes chiefly occurring in granite, or killas.

The climate is mild, especially in winter, but damp, with almost daily rain. Snow rarely lies above a few days. South-west winds prevail for nine months in the year, and furious gales are frequent. Some plants of the south of Europe, as the myrtle, tamarisk, and balm of Gilead, flourish in the open air; but fruits do not ripen well. The soil is light, gravelly, or slaty. The land is generally barren in the mining tracts, but fruitful in the valleys and on the coast. The chief crops are barley, wheat, oats, and potatoes; but harvest is generally later than in the inland counties. Near Penzance, however, two crops of potatoes are got yearly. C. is far more a mining than an agricultural county. The pilchard-fishery is very profitable, and employs a large number of people from July to September.

The only exports are mining produce and fish. Landed property is much divided. The total area of C. is 873,600 acres, or 1365 square miles. The population was 362,343 in 1871, and 329,484 in 1881. About 30,000 persons are employed in the mines. For electoral purposes, C. is divided into an eastern and a western division, each of which returns two members to parliament. C. has ancient British antiquities, such as rude, upright stone blocks, single and in lines, circles, barrows, and cromlechs. Many Roman coins, &c., have been found. There are many Saxon camps and earth-works. C. and the Scilly Isles were the Cassiterides, or tin isles of the Phœnicians and Greeks. Vortigern made C. a kingdom in 446 A.D. The West Saxon kings subdued it in 650. The Saxons and Danes overran it in the 9th and 10th centuries. C. has remains of ancient castles and monasteries. It was erected into a duchy in 1329, in favor of the Black Prince, eldest son of Edward III., who, with the succeeding princes of Wales, had immense revenues from the county. The dukedom is still held by the Prince of Wales, who derives from it a revenue of £80,000, and appoints the sheriffs. The Cornish tongue, a Celtic dialect, became extinct only in the present century.

CORNWALLIS, CAROLINE FRANCES, was born on the 12th July 1786, and was daughter of a clergyman in Kent. She acquired a thorough knowledge of Latin and Greek, and made herself conversant with nearly every study which occupies thoughtful men—with philosophy, theology, history, natural science, social science, politics, and even law. From an early age she carried on a correspondence on such subjects with many eminent persons; and a valuable selection from her *Letters* has been published. Her first work, *Philosophical Theories and Philosophical Experience, by a Pariah*, appeared in 1842. It was the first of a series of 20 'Small Books on Great Subjects,' nearly all of which were written by her. The subjects discussed were very various—the Connection of Physiology and Intellectual Science, Ragged Schools, Grammar, Criminal Law, Chemistry and Geology, Greek Philosophy, and the History and Influence of Christian Opinions. The works in which the last-mentioned subject was treated—*The State of Man before the Coming of Christ* (1 vol.), and *The State of Man after the Coming of Christ* (3 vols.)—were so judiciously written, that, though presenting a system of thought and belief entirely different from our orthodox Christian teaching, they were favorably received by many of every religious party. The series as a whole attracted much attention in this country, and still more in America. Miss C. also published in 1847, *Pericles, A Tale of Athens;* and in 1853, a prize essay on Juvenile Delinquency. She died near Tunbridge Wells, 8th January 1858. See her *Letters and Remains* (1864).

CORNWA'LLIS, CHARLES, MARQUIS, an English general and statesman, son of the first Earl Cornwallis, was born December 31, 1738, and was educated at Eton and Cambridge. He served as aide-de-camp to the Marquis of Granby in the Seven Years' War; in 1776 was made a colonel, and four years later, governor of the Tower of London. Though personally opposed to the war in America, he accompanied his regiment thither, and with an inferior force gained victories over General Gates at Camden in August 1780, and over General Greene at Guilford, March 1781. In the

same year, however, he was forced to surrender with all his troops at York Town, Virginia. This disaster proved the ruin of the British cause in America, and was the occasion of much dissatisfaction, resulting in a change of ministers at home. C., however, who was high in favor with the king, escaped censure. In 1786 C. was appointed governor-general of India and commander-in-chief, and in this double capacity distinguished himself by his victories over Tippoo Saib, and by his unwearying efforts to promote the welfare of the natives. His measures, however, were far from answering the purposes he intended. He returned from India in 1793, when he was raised to the rank of Marquis. Appointed lord-lieutenant of Ireland in 1798 during the time of the Rebellion, he succeeded in putting it down, and in establishing order in a manner that gained him the good-will of the Irish people. As plenipotentiary to France, he negotiated the peace of Amiens. Reappointed governor-general of India in 1804, he died at Ghazipore, in the province of Benares, in Oct. 1805, on his way to assume the command of the army in the Upper Provinces. As a statesman or warrior, C.'s talents did not rise much above respectable mediocrity, but he was upright, diligent, and humane in a more than ordinary degree.

CORO'LLA, in Botany, the inner floral envelope of the greater number of phanerogamous plants; the second of those whorls of modified leaves which form the flower (q. v.). It is in the C. that fine colors and the greatest delicacy and beauty of the flower are in general chiefly displayed. The modified leaves of which it is composed are called *petals*, and are very various in form and number. They are also in very many plants united into a tube at the base, when the C. is said to be *monopetalous;* and this union often extends through their whole length, leaving their number to be discerned merely in the teeth in which the C. (bell-shaped, funnel-shaped, tubular, &c.) terminates. The petals of a flower are either similar when the C. is said to be *regular*, or they differ in form, often very widely, when it is called *irregular*. They not unfrequently assume remarkable and even grotesque forms.

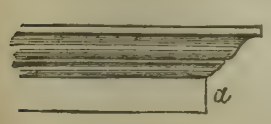
Many petals have appendages of various kinds, as *scales*, *nectaries*, *spurs*, *coronæ* or *crowns*, &c. Petals often consist of a *limb*, or expanded portion, and a *claw*, the narrower part, which is covered by the calyx, and by which the petal is attached, but sometimes the claw is wanting or obsolete, sometimes it is united with the tube of the calyx, so that the petals appear to rise out of the calyx. See CALYX and PERIANTH.

CO'ROLLARY, a proposition the truth of which appears so clearly from the proof of another proposition as not to require separate demonstration.

COROMA'NDEL COAST, often vaguely taken as the whole of the west shore of the Bay of Bengal, extends, in its proper acceptation, from Point Calimere, in lat. 10° 17′ N., long. 79° 56′ E., to Gondegam, in lat. 15° 20′ N., long. 80° 10′ E. It is pretty nearly co-extensive with the districts of Tanjore, Arcot, Chingleput, and Nellore, comprising, along with Madras and Pondicherry, the grand battle-field of last century between England and France in India. With various estuaries and inlets, it is yet commercially of very little value, not presenting a single safe place of refuge for large vessels. So shallow, moreover, is the water for a considerable distance from the land, that ships of any size are obliged to lie several miles off; while the intermediate space, or at least that belt of it that is nearest the beach, presents a surf in which no ordinary boat can live—the only safe craft being the native catamaran (q. v.).

CORO'NA, or CROWN, in Botany, an appendage of the corolla in some flowers; sometimes assuming the appearance of an interior corolla very different from the true corolla, and either divided into parts resembling petals, or consisting only of one piece, and surrounding the organs of fructification like a monopetalous corolla; sometimes assuming very peculiar forms. It is often difficult to determine whether the C. is properly to be regarded as belonging to the row of petals, or to that of stamens. The C. was included by Linnæus under the very comprehensive term nectary. A familiar example may be seen in *Narcissus;* forms very different may be seen in *Stapelia*, and other genera of the natural order *Asclepiadaceæ*.

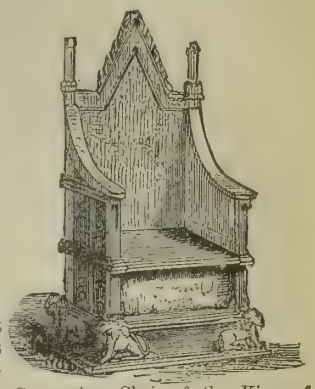
CORONA (Lat. a crown), in Architecture, the drip, or lower member of the projecting part of a classical cornice. See ENTABLATURE. The term C. is also applied to the apse or semicircular termination of the choir, especially by ecclesiastical writers. Hence we hear of 'Becket's crown,' at Canterbury. C. is also applied in ecclesiastical nomenclature, to a chandelier, in the form of a crown or circlet, suspended from the roof of a church, or from the vaulting of the nave or chapels, to hold tapers which are lighted on solemn occasions.



a. the Corona.

CORONA BOREA'LIS, a small and bright constellation near Hercules.

CORONA'TION. The use of crowns in antiquity, as a mark either of honor or of rejoicing, will be explained under CROWN. It was, no doubt, as an adaptation of this general custom to a special use that the practice of placing a crown on the head of a monarch at the commencement of his reign was introduced. The practice is very ancient, as we may learn from the fact that Solomon and Ahaziah were crowned; and there is probably scarcely any country in which it has not been followed in one form or another. Generally it has been accompanied by what was regarded as the still more solemn rite of anointing with oil, a ceremony which, from the times of the ancient Hebrews to our own, has been peculiarly significant of consecration or devotion to the service of God. The term employed for C. in the Saxon chronicle, 'gehalgod,' is hallowed or consecrated; and it would seem that the ceremony as then performed at Kingston-on-Thames or Winchester, was in all essentials the same as that which now takes place in Westminster Abbey. A copy of the gospels is still in existence amongst the Cottonian MSS. in the British Museum, which is believed to be the identical copy on which the Saxon kings were sworn. Detailed accounts of many English coronations, from Richard I. downwards, have been preserved. The Scottish coronation stone, the *Lia Fail* or 'Stone of Destiny,' was said by tradition to have been the stone which Jacob used for a pillow, to have been brought to Ireland, and from Tara to Scotland, where it finally found a resting-place at Scone. Skene, in his monograph (1869), asserts it to have been originally quarried from the rocks near Scone. See *Chapters on Coronation* (1838).



Coronation Chair of the Kings of England, kept in Westminster Abbey.

Beneath the seat is the 'Stone of Destiny,' carried off from Scone by Edward I. in 1296.

CORONATION GULF, an inlet of the Arctic Ocean, forms the south-east part of the landlocked and isle-studded bay that receives the Coppermine.

CORONATION OATH. The form in which the limitations imposed on the monarch were defined by the nation and accepted by him, was probably from the first something equivalent to a coronation oath. Up to the period of the revolution, however, the C. O., like all the other guarantees for popular liberty, admitted of being tampered with; and there is in existence (Cottonian MS., Tib. E. viii.) a copy of the oath sworn by Henry VIII., interlined and altered with his own hand.

To obviate the possibility of such proceedings for the future, the existing C. O., altered only in consequence of the subsequent unions between England and Scotland, and Great Britain and Ireland, was fixed by stat. 1 Will. and Mary, st. 1, c. 6. It is to the following effect, and thus administered. The Archbishop of Canterbury demands of the king (or queen): 'Sir (or Madam), is your Majesty willing to take the oath?' and on the king answering, 'I am willing,' the archbishop ministereth these questions; and the king, having a copy of the printed Form and Order of the Coronation Service in his hands, answers each question severally, as follows:

Archb. Will you solemnly promise and swear to govern the people of this United Kingdom of Great Britain and Ireland, and the dominions thereto belonging, according to the statutes in parliament agreed on, and the respective laws and customs of the same?

King. I solemnly promise so to do.

Archb. Will you, to your power, cause law and justice, in mercy, to be executed in all your judgments?

King. I will.

Archb. Will you, to the utmost of your power, maintain the laws of God, the true profession of the Gospel, and the Protestant reformed religion, established by law? And will you maintain and preserve inviolably the settlement of the United Church of England and Ireland, and the doctrine, worship, discipline, and government thereof, as by law established within England and Ireland, and the territories thereunto belonging? And will you preserve to the bishops and clergy of England and Ireland, and to the churches there committed to their charge, all such rights and privileges as do, or shall appertain unto them, or any of them?

King. All this I promise to do.

The sovereign then goes to the altar, and, laying his hand upon the Gospels, takes the following oath: 'The things which I have heretofore promised, I will perform and keep, so help me God.'

The sovereign then kisses the book, and signs the oath.

The passage of the oath in which the sovereign guarantees the privileges of the Church of England, is framed in conformity with the 'Act for Securing the Church of England as by Law Established,' which is declared to be a fundamental and essential part of the Treaty of Union, and which was inserted accordingly in the Act by which the Treaty of Union was finally ratified. The passage in the act which provides for the security of the Church of Scotland was framed in conformity with an 'Overture for an act for security of the Church'—of which a copy will be found in the Appendix to Defoe's *History of the Union*, p. 617. It is to the effect that, 'after the decease of her present Majesty (whom God long preserve), the sovereign succeeding to her in the royal government of this kingdom shall, in all time coming (not at the coronation), *at his or her accession to the crown, swear and subscribe* that they shall maintain and preserve the foresaid settlement of the true Protestant religion, with the government, worship, and discipline of this Church, as above (that is, by the previously recited act, 1 Will. and Mary, c. 5) established, inviolably.' The security of the Church of Scotland is thus provided for, by what may be called an accession oath, even during the period which must intervene between the accession of the sovereign and his coronation. The oath has not yet been altered to suit the disestablishment of the Irish Church.

CORONE'LLA, a genus of non-venomous serpents of the family *Colubridæ*, of a small size, having a somewhat compressed and generally pentagonal body, and rather long conical tail. They inhabit the warm and temperate parts of the world. One species, *C. lævis*, is found in the center and south of Europe.

CO'RONER (Lat. *coronator*, *corona*, a crown), a very ancient officer, in England, at the common law. He is mentioned in a charter of King Athelstan, 905 A.D.; and the office, like much of the common law, is acknowledged to be of Saxon origin. The name is derived from the fact, that the C. has chiefly to do with pleas of the crown. In this light, the Lord Chief-Justice of the Queen's Bench is the principal C. in the kingdom, and may exercise jurisdiction in that capacity in any part of England. There are, however, particular coroners for every place in England, and in some counties, three or four, or even more. They were formerly paid by fees on each inquest, but now (23 and 24 Vict. c. 116) by salary paid out of the county rate.

The C. is chosen for life, and the election rests with the freeholders of the county or district. A C. may, however, be dismissed by the Lord Chancellor for inability or misbehavior in his office. By the statute of Westminster the first (3 Edw. I. c. 10), it was enacted that none should be chosen but lawful and discreet knights; and in the time of Edward III., there is an instance of a man being removed from the office because he was merely a merchant. Subsequently, it was thought sufficient if a man had lands enough to entitle him to be made a knight; and Blackstone complains that in his time it had come to be sought for the perquisites, and not for the honor of serving the country. This motive has now ceased. The C. is now usually a professional man, frequently an attorney or a medical man.

The office of C. is to some extent the only one in England charged with the investigation of crime. Where the C. cannot act, there is no authority to examine witnesses until a suspected person has been actually charged or accused before a magistrate. But even the C.'s duties are very limited, and little is added to the statute 3 Edw. I. The C. can inquire only into the causes of violent or sudden death, and into these only when the body has been found. When such a death happens, it is the duty of the constable to give notice of it to the C., who then summons a jury from the body of the county for the purpose of making an inquisition into the matter. The C. presides over the inquisition, and the court thus constituted is a court of record. The jury consists of twelve men at least, who are sworn and charged by the C.; and the verdict must be of twelve. By 6 and 7 Vict. c. 12, it has been enacted that the inquest shall be held before the C. in whose district the body shall be 'lying dead.' If any be found guilty by such inquisition of murder or other homicide, the C. is to commit them to prison for further trial, and is also to make inquiry concerning their lands, goods, and chattels (which are forfeited thereby), if not otherwise known; and he must, moreover, certify the whole of this inquisition under his own seal and the seals of the jurors, together with the evidence thereon, to the Court of Queen's Bench or the next assizes. The accused may thereupon be put on his trial without other indictment. By 6 and 7 Will. IV. c. 89, the C. is empowered to summon, and by 1 Vict. c. 68 to pay, medical witnesses, in place of referring them for payment to the church-wardens. The sums allowed are one guinea for a simple examination, and two guineas if a *post-mortem* examination of the body has been made. By 6 and 7 Vict. c. 83, coroners are empowered to appoint deputies in case of absence from illness or other reasonable cause. 9 and 10 Vict. c. 37 regulates the duties of the C. and the expenses of inquests in Ireland.

Another branch of the C.'s office is to inquire concerning shipwrecks and treasure-trove; but this has been nearly superseded by the provisions of the Merchant Shipping Act, 1854. He is a conservator of the king's peace, in which capacity he is mentioned in one of the oldest treatises on the common law (*Mirror*, c. 1, s. 3). As such, he may cause felons to be apprehended, whether an inquisition has found them guilty or not. The C. has likewise ministerial functions as the sheriff's substitute, in executing process in suits in which the sheriff is related either to the plaintiff or defendant. Latterly, the office of C. has been the subject of consideration, with a view to certain reforms of administration. In many cases, it is alleged that the C. makes a job of his office, trumps up cases, and acts vexatiously at variance with the warrants of magistrates. Coroners or crowners, as they were also called in England, are mentioned in many old Scottish statutes; and there is no doubt that the office, as well as that of alderman and mayor, existed in those parts of the country that were peopled by persons of Teutonic race. But it was abolished or fell into desuetude, probably in consequence of the succession war and the French connection; and in Scotland the duties are now chiefly performed by the officer appointed by the crown, styled the Procurator-fiscal (q. v.).

CO'RONET. See CROWN.

COROT, JEAN BAPTISTE CAMILLE (1796—1875), a noted landscape-painter, the son of a milliner in Paris, and educated in the Lyceum of Rouen. After studying landscape-painting under Michellon and Victor Bertin, he went, in 1826, to Italy, where the landscape-painter Aligny exercised an influence on him long traceable in his works. His 'Vue prise à Narni,' and 'Campagne de Rome,' sent in 1827 to the Paris Exhibition, displayed a selection and grouping of natural objects at variance with the realistic style that was then coming into vogue, and though he continued persistently appealing to the visitors of art exhibitions in Paris by 'heroic' and 'idyllic' landscapes, he obtained little recognition for thirty years. Not till he was 60 years old did he come to be a pet of the day, and see his pictures mount up to ten and twenty times their former value. With all their careless and sketchy execution, C.'s pictures evince true artistic qualities. His predilection is for shadowy scenes, for vernal and autumnal vapors, for meadows and bushy trees wrapped in a dull atmosphere. His works, therefore, lose hardly any of their effect in Français's excellent lithographs. Among his pictures in the Luxembourg Museum of Paris are the *Dance of the Nymphs*, *Marseilles*, and a *Sunset in the Tyrol*. *Dante* and *Hagar in the Desert* he bequeathed to the Louvre Gallery.

His *Mornings* and *Evenings*, his *Rains* and *Fogs*, scattered in private collections, are to be counted by the hundred. He has had a number of imitators, 'Impressionists,' as they are called, who, however, lose themselves completely in the vague and formless.

CO'RPORAL (more properly *Caporal*, from the Italian *capo di escadra*) is, so far as concerns the British army at the present day, the grade next below non-commissioned officers. When the regiment is formed as a corps, he has no function different from the private soldier. In barracks or camp, however, he exercises certain disciplinary control over the privates. At present, in the British army, there are 32 corporals to each regiment of cavalry, and 40 for each infantry battalion. They receive pay varying from 1*s.* 3*d.* to 2*s.* 5*d.* per day. The lance-C. is an assistant C., who remains, however, on private's pay; he wears one *Chevron* (q. v.) on his arm, and two when he rises to the rank of corporal.

On shipboard, there is a ship's corporal, a petty-officer under the master-at-arms; to aid in teaching the seamen the use of small-arms, to guard against the smuggling of spirits on board, to extinguish the fires and lights at a given signal, and to keep order below at night.

CORPORAL (Lat. *corpus*, a body, because of the belief that the bread and wine are the body and blood of our Saviour), a name given to the cloth with which the minister covers what is left of the consecrated elements in the Lord's Supper until the service is concluded. It is also called the *Pall*, and its use is of the highest antiquity.

CORPORAL PUNISHMENTS. See FLOGGING.

CORPORA'TION. This, in England, is either aggregate or sole. A C. aggregate is a society of persons authorized by law to act as one person, and to perpetuate its existence by the admission of new members. Without such legal authority, the acts of the society would be regarded only as the acts of the individuals, and the property of the society would descend to the heirs of the individual members. A C. sole consists of one person, and his successors, who are by law invested with the same capacities as a C. aggregate. The sovereign is a C. sole, and so is a bishop and the vicar of a parish, for these in the eye of the law never die, and each successive holder of the office takes the property belonging

to it, neither by conveyance nor by ordinary succession, but is vested in it by his mere holding of the office.

A C. could formerly be established only by charter from the crown or act of parliament, unless, indeed, it existed by immemorial prescription; but of late years the exigencies of commerce have led to the passing of various enactments, by compliance with which any society of persons may acquire for themselves the character of a corporation. The particulars of these will be considered under the title JOINT-STOCK COMPANIES. A C. always receives a corporate name, by which it sues and is sued, and it must possess a common seal, the affixing of which is the only competent way of affixing the signature of the corporation. The majority of the members of a C. are entitled to act in its name, and may, by a by-law, even delegate—except in the case of municipal corporations—the power of acting in its name to a certain number of its members. For the acts of the C., none of its members are personally liable. A C. may hold lands—subject to the statutes of Mortmain (q. v.)—and may be possessed, if a C. aggregate, of chattels; but a C. sole has not this privilege, unless it be the representative of a number of persons for whose benefit the chattels are held. But no C. can be either a trustee-proper or an executor.

Corporations, whether aggregate or sole, are divided into ecclesiastical and lay, and the lay are subdivided into civil and eleemosynary. The ecclesiastical are such as are composed wholly of clergymen, in their ecclesiastical capacity, and are chiefly for the purpose of holding ecclesiastical property. Civil corporations include municipal corporations, the universities, the colleges of physicians and surgeons, learned societies, and many trading companies incorporated. Eleemosynary corporations are for the administration of funds for charitable and pious purposes, such as hospitals, the colleges in universities, &c. An important consequence of these distinctions, is the effect it has on the right of *visiting* a C., or exercising a legal superintendence over its proceedings. The crown is the visitor of the archbishops, each archbishop is the visitor of his suffragan bishops, and each bishop is the visitor of all the ecclesiastical corporations in his diocese. Civil corporations have no visitor, but the Court of Queen's Bench is the authority entitled to restrain and direct them. Eleemosynary corporations are visited by the founder and his heirs, or such persons as the founder appointed to be visitors; and in default of such persons, or of the founder's heirs, the Court of Chancery acts as visitor. Hospitals, if of ecclesiastical nature, are, however, subject to the visitation of the bishop.

A C. may be dissolved by the death of all its members, or of such number as leaves not enough to make new elections in the way the charter requires; by forfeiture of the charter, through breach of its conditions; by surrender of the charter; or by act of parliament. In all such cases, the lands of the C. revert to their several donors, and the debts due by or to the C. are extinguished.

Municipal corporations, formerly dependent on special charter alone, are now made uniform, and regulated by the 5 and 6 Will. IV. c. 76, and some subsequent acts. See MUNICIPAL CORPORATION.

As to public corporations in Scotland, see BURGH, TOWN COUNCIL, FRIENDLY SOCIETIES; and as to private corporations for trading purposes, see BANK, LIABILITY (limited), PARTNERSHIP.

CORPS D'ARMÉE, in the military system of the greater continental European states, is an organization of the forces in the time of peace. The whole military strength is divided into several corps, each complete in itself as an army, with everything needful for service, staff and artillery park included. The English army is now distributed into eight army corps, stationed in eight territorial centers. The French army had in 1879 nineteen *corps d'armée;* which have been increased in strength by the recent military reorganization. Germany had in the same year eighteen *corps d'armée.* In the Austrian service, the normal number of *corps d'armée* is thirteen. The military strength of Russia, as finally settled in 1876, is distributed over fourteen military districts.

CO'RPSE-CANDLE. See CANDLE.

CO'RPUS CHRI'STI, or BE'NET COLLEGE, Cambridge, was founded by two guilds or fraternities of townspeople—the guild of Corpus Christi, who had their prayers at St. Benedict Church; and the guild of the Blessed Virgin, who prayed at St. Mary's. These were united in 1352, and a small college erected by them. Archbishop Parker added largely to the endowments of this college, and bequeathed to it his valuable manuscripts, amongst which are the only authentic manuscript copies of the Thirty-nine Articles of the Church of England. Of the 12 fellows, all except 4 must take holy orders. There are thirty-one scholarships, some of considerable value, given to the students who most distinguish themselves at the annual examinations. Among the eminent men of this college were Hugh Latimer, Archbishops Parker and Tennison, Fletcher the dramatist, and Gough the antiquary.

CORPUS CHRISTI, Oxford. This college was founded in 1516 by Richard Fox, Bishop of Westminster, under a license from King Henry VIII. The statutes were issued in 1517. The foundation consisted of 20 fellows and 20 scholars; of whom the fellows were to be elected from the scholars, while the scholars were to be elected from certain specified counties. Two peculiarities marked this foundation. First, the usual rules of life and discipline were enforced with peculiar severity; and, second, the object of the college was expressly connected with the studies of the age. Classical literature was for the first time distinctly mentioned. The subjects of the lectures were enjoined to be, not the old routine of divinity and the two philosophies, but divinity, humanity, and Greek.

Incessant industry in these pursuits was inculcated by the founder, and the fellows were even forbidden to accept the proctorship, lest the avocations of that office should interfere with their proper duties. The object and the stringency of these regulations called forth the celebrated encomium of Erasmus, that what Colossus was to Rhodes, what the Mausoleum was to Caria, that C. C. College would be to the kingdom of Great Britain. This prediction has hardly been fulfilled. The rules of the founder have been gradually set aside by acts of parliament, by custom, and by injunctions of the visitor. Of the three university lectureships contemplated by the founder, one was never founded at all, and the other two were merged in the college fellowships and tutorships. And, lastly, the college has suffered greatly from the severe restrictions imposed by statute upon the elections to fellowships. In virtue of the powers conferred by 17 and 18 Vict. c. 81, important changes have been effected by the college working in harmony with the commissioners. Both fellows and scholars are now elected without any restrictions as to place of birth. The fellowships are still 20 in number, value rather more than £300 a year. The college is now one of considerable eminence. Two of the fellowships are permanently attached to the two professorships of Latin and Jurisprudence, the professors being admitted honorary fellows of Corpus, and each receiving from its revenues a sum of £600 a year. The scholarships are 24 in number, tenable for five years, and of the annual value of £80, with rooms rent free; besides seven exhibitions recently instituted to be competed for annually by the commoners of the college. There are 22 benefices in the gift of this college; and in the year 1881, there were about 280 names on the college books.

CORPUS CHRISTI FE'STIVAL, the most splendid festival of the Roman Catholic Church. It was instituted in 1264, in honor of the Consecrated Host, and with a view to its adoration, by Pope Urban IV., who appointed for its celebration the Thursday after the festival of the Trinity, and promised to all the penitent who took part in it, indulgence for a period of from forty to one hundred days. The festival is chiefly distinguished by magnificent processions. In France, it is known as the *Fête Dieu.*

CORPUS DELI'CTI, a criminal law term used in Scotland to signify the body or substance of the charge. Before a conviction can take place, the fact libelled must be proved—e. g., before a man can be convicted of murder, it must be clearly made out that there was a murder; and it is this fact that is called the corpus delicti. See CRIMINAL LAW.

CO'RPUSCLES, BLOOD. See BLOOD.

CORRE'CTION, HOUSE OF, a prison for the reformation of petty offenders. See PRISON, REFORMATORY.

CORRECTION OF THE PRESS. This is one of the most important of the many operations that every piece of printed matter must undergo before it is put into the hands of the reading public; and in every considerable printing establishment, it forms a special department executed by one or more functionaries, technically called 'Readers.' The immediate object of a corrector of the press, or 'reader,' is to observe and mark every error and oversight of the compositor, with a view to make the printed sheet a perfect copy of the author's manuscript. This is on the supposition that the manuscript itself is quite correct, which is seldom the case; and therefore the duty of a good reader extends to seeing that there are no inconsistencies in orthography, punctuation, abbreviations, &c., and in many cases to the verification of quotations, dates, and proper names. The duty of securing consistency in spelling and punctuation is especially important in the case of works on which several writers are employed, such as newspapers and encyclopædias. The corrector has also to direct his attention to the numbering of the pages; to the arrangement of chapters, paragraphs, and notes; to running titles, &c. It is part of his business to observe the mechanical defects of the work—defective types, turned letters, inequalities of spacing between words, sentences, and lines, crooked lines, and to secure symmetry in verses, tables, mathematical operations, and such like. In almost all cases, two proofs are taken, and in difficult works, such as those in foreign languages, tables, &c., even more. Lastly follows the revision, in which little more is done than seeing that the com-

positor has made all the corrections marked on the last proof. It is usual for the writer or author to reserve the correction of the second proof for himself.

In printing regular volumes, one sheet is usually corrected at a time; but where extensive alterations, omissions, or additions are likely to be made by writer or editor, it is more convenient to take the proofs on long slips, before division into pages. The corrections to be made are marked on the margin; and for this purpose an established set of signs or short-hand is used, understood by all printers, and which it is often useful to know. The following specimen of a proof exhibits the application of most of these signs:

WILLIAM FALCONER.

William Falconer was the son of a ~~ϕ~~ barber in Edinburgh, ~~ϕ~~nd was born in 1730. He had very few advantages of education, and went to sea in early life in the merchant service. He afterwards became mate of a vessel that wrecked in the Levant and was saved with only two of his crew: this catastrophe formed the subject of his poem entitled "The Shipwreck, on which his reputation as a writer chiefly rests. Early in 1769, his "*Marine Dictionary*" appeared, which has been highly spoken of by those capable of estimating its merits.

In this ~~seam~~ year, he embarked on the AURORA but the vessel was never heard of after she passed the Cape; the poet of the Shipwreck is therefore supposed to have perish'd by the same disaster he had ~~himself~~ so graphically described. ¶ The subject of the "Shipwreck" and its authors fate demand our interest and sympathy. If we pay respect to the ingenious scholar who can produce agreeable verses in leisure and retirement, how much more interest must we take in the "shipboy on the high and giddy mast', cherishing the hour which he may casually snatch from danger and fatigue.

refined visions of fancy at

1. Alteration of type. 2. Small caps. One line is drawn under the word for *italics*, two for SMALL CAPITALS, three for CAPITALS. 3. A word or letter to be deleted. 4. A wrong letter. A line is drawn through the wrong letter, and the proper one written in the margin. After every mark of correction a line | should be drawn, to prevent its being confounded with any other in the same line. 5. A turned letter. 6. Letter or words to be inserted. 7. A word or letter to be transposed. Where letters only are to be transposed, it is better to strike them out, and write them in their proper sequence in the margin, like a correction. 8. Change to italics. 9. Period, or close of sentence. 10. A space or quadrat sticking up. 11. The manner in which the apostrophe, inverted commas, the star and other references, and superior letters and figures, are marked. 12. Indicates a broken letter. 13. A letter of a wrong fount. 14. Roman type. 15. The space to be removed and the letters closed up. 16. A space wanted. This mark is also used when the spacing is insufficient. 17. Denotes slip of a letter, either up or down, and is to be straightened. 18. No new paragraph; the lines to be run on. 19. Directs a capital letter or word to be made small. 20. A new paragraph. This should be avoided as much as possible, as it causes great trouble and expense. 21. When letters or lines do not stand even. 22. Em-dash; hyphen. 23. Denotes that the lines do not range. 24. Lead to be taken out. 25. Lead to be put in. 26. Bad spacing between the words. 27. A word struck out, and afterwards approved of (Lat. *stet*, let it stand).

The thankless and monotonous business of a corrector or reader is more difficult than the unintiated would believe. It requires extensive and varied knowledge, accurate acquaintance with the art of typography, and above all, a peculiar sharpness of eye, which, without losing the sense and connection of the whole, takes in at the same time each separate word and letter. After the invention of printing, the C. of the P. was executed by the publisher himself, or at least was entrusted to men of ability and learning, and often men of name. Robert Stephen (1526—1559), and Plantin (1555—1589), had recourse to publicity, hung out the successive sheets of their publications, and promised a reward to any one who would point out a typographical error. Some editions of particular works are held in high estimation from the care with which the press had been corrected. Among the most famous are those that issued from the press of Aldus Manutius in Venice, of which we may mention the works of Petrarch (1514), corrected by Pietro Bembo; Aristotle (1551—1553, 6 vols.), corrected by the famous Greek scholar, J. B. Camotius; Lactantius (1515), and Suetonius (1516), corrected by J. B. Egnatius; Plato (1513), Athenæus (1514), and Gregory Nazianzene (1516), corrected by Marcus Massurus. The first edition of Homer was printed by Nerlius in Florence (1484, 2 vols.), corrected by Demetr. Chalkondylas. Robert Stephen of Paris himself corrected the numerous works that issued from his press; and Erasmus had a great name as a corrector.

CORRE'GGIO, ANTONIO ALLEGRI, a celebrated Italian painter, called C. from the place of his birth, a small town near Modena, now called Reggio. He was born in the year 1493—1494, and his father, a tradesman of some property, had him carefully educated, and instructed in the rudiments of art, by an uncle, Lorenzo Allegri, a painter of small merit. How much he owed to his teacher is uncertain. He was the first among the moderns who displayed that grace and general beauty and softness of effect, the combined excellences of design and color with taste and expression, for which he is still unrivalled. His chiaroscuro is perfect. Almost before he had seen the great masters, he became a master in a style all his own; and was the founder, or rather his imitators for him, of what is called by some the Lombard, by others the Parma school of painting. On first beholding, at Bologna, Raphael's glorious picture of St. Cecilia, he is said to have exclaimed: 'Anch, io sono pittore' ('I, too, am a painter'). But this story is doubted.

There was long a tradition that C. lived in indigence, unaided but by his own genius; and it is remarkable that Vasari, who lived at the same time, in his *Lives of the Painters*, records only vague rumors regarding C.'s life; and that Annibale Caracci, fifty years after his death, writes: 'I rage and weep to think of the fate of this poor Antonio, so great a man—if, indeed, he were not rather an angel in the flesh.' This belief, so prevalent in his own day, now refuted by recent researches, proves how retired and simple must have been his life. That he was in high estimation in his later days, is proved by his signature being found affixed to the deed of marriage of the Lord of Correggio, celebrated in 1533. C. died in the following year, March 5, 1534, in his 41st year, and is buried in the Franciscan convent of Correggio.

At the age of 18, C. painted an altar-piece, the 'Madonna di San Francesco,' now in the Dresden Gallery, which is rich in pictures by C.; the most famous of which are the 'Notte' (Night), lightened only by the celestial splendor beaming from the head of the infant Saviour—Vasari calls it 'quite wonderful'—and the famous 'Magdalen,' one of the most admired pictures in the world. For the cupola of the church San Giovanni at Parma, he painted an 'Ascension' in fresco, and over the high-altar a 'Coronation of the Virgin,' now only known through copies and engravings. He also decorated elaborately in fresco the cathedral there, for which he received 1000 ducats, worth about £3500. In the Louvre are two pictures—the 'Marriage of St. Catharine' and the 'Antiope;' in the Florence Gallery, three—one the 'Madonna on her knees adoring the Infant;' in the Naples Gallery, three—one a lovely Madonna, called, from its oriental character, 'La Zingarella' (the Gypsy), said to be a likeness of C.'s wife; at Vienna, two; at Berlin, three; at Parma, five—the most celebrated is the 'St. Jerome;' and in the British National Gallery, a Madonna, known as the 'Vierge au Panier,' the 'Education of Cupid,' and the famous 'Ecce Homo,' purchased by the British Government for £11,500.

CORRE'GGIO, a town of Northern Italy, midway between Parma and Modena; pop. 2700. It is the birthplace of the painter surnamed Corregio (q. v.).

CORRE'GIDOR is the name given in Spain to the principal magistrate of a town. He is appointed by the king. The C. is also a Portuguese functionary, but, unlike his Spanish brother, does not possess the double power of governing and administering justice, but only the latter.

CORRELA'TION OF PHYSICAL FORCES. See FORCE.

CORRÈZE, a department of France, formed out of part of the old province of Limousin, and taking its name from an affluent of the Vezère—the Corrèze, which traverses the department from north-east to south-west. C. extends between lat. 44° 55′ and 45° 40′ N., and long. 1° 13′ and 2° 22′ E.; its total area is nearly 2300 square miles, and its population, in 1881, 311,478. The chief

rivers of C. are the Dordogne, the Vezère, and the Corrèze. The surface of the department is mountainous, especially in the north and east, where it is broken in upon by offsets from the Auvergne mountains, which, in some parts, attain a height of 4000 feet above the sea. The lower slopes are clad with forests, but the district is in general sterile. In the south and south-west, however, the soil yields wheat, oats, barley, rye, maize, &c. Wine is also produced, but of poor quality. The rural population are poor, badly housed and fed; their food consisting, to a great extent, of chesnuts, which are very abundant. Minerals, particularly coal, iron, lead, alabaster, and granite of various colors, are found in considerable quantities. The department is divided into the three arrondissements of Tulle, Brive, and Ussel. Tulle is the chief town.

CO'RRIB, Lough, a lake, the third in size in Ireland, in the north of Galway. It is of very irregular shape, 27 miles long from N.W. to S.E., and 1 to 6 broad, with an area of 68 square miles. It is between 28 and 31 feet above the sea-level. From its south end, 4 miles north of Galway, it discharges its surplus waters by Galway River into Galway Bay. It receives the waters of Lough Mask, at its north end, through the Pigeon Hole and other caves, as well as those of the Clare and other smaller rivers. On its sides are metamorphic rocks, carboniferous limestone, and marble. Near it are many monumental heaps and so-called Druid circles. It contains many islets, and to the west are mountains 3000 feet high.

CO'RRIDOR is a gallery or passage running (It. *correre*, Sp. *correr*, to run) or leading to several rooms, each of which has a door opening into it. Spacious corridors are necessary in all public buildings, such as hospitals, prisons, &c.

CORRIENTÉS (in English, *currents*) is a name of various application in Spanish America. Besides indicating several capes in Cuba, Mexico, and New Granada, it is more conspicuously connected with one of the States of the Argentine Confederation and with the capital of the same. 1. C., the city, stands in lat. 27° 27′ S., and long. 58° 46′ W., near the confluence of the Parana and the Paraguay. It takes its name from the rapids, which are said to be as decidedly a turning-point in the climate of the country as in the navigation of the river. Pop. 11,000. 2. C., the province, lies between Entre Rios on the south, and the republic of Paraguay on the north, having the Parana on the north and west. Lat. 27°—30° S., and long. 57°—59° W. Area about 60,000 sq. miles; pop. (1869) 129,023. The north is undulating and fertile; and the south, besides being generally swampy, is partly covered by Lake Thara. The products are maize, cotton, sugar, indigo, tobacco, and a species of silk.

CORRIEVRE'KIN, or CORRYBRE'CHTAN, or Gulf of Brechan, a whirlpool or dangerous passage a mile broad, off the west coast of Argyleshire, in the strait between Scarba and Jura isles. It is occasioned by the meeting of tides (often running 12 or 14 miles an hour) from the north and west, in the narrow passage into the Sound of Jura, round a pyrmidal rock, which rises with rapid slope from a considerable depth to some fathoms from the surface. This rock forces the water in various directions. In stormy weather, at flow-tide, vast openings form in the water, immense bodies of water tumble headlong as over a precipice, then rebounding from the abyss, dash together and rise in spray to a great height. The noise is heard over the isles around. The water is smooth for half an hour in slack-water.

CORRO'SIVE SU'BLIMATE, the popular name of Bichloride of Mercury (q. v.).

CO'RRUGATED IRON (Lat. *ruga*, a wrinkle). Common sheet-iron, and what is improperly called 'galvanized iron' (i. e., sheet-iron coated with zinc by immersion in a bath of the fused metal), have of late been made available for many useful purposes, by virtue of the great additional strength imparted to the sheets by corrugation, which is merely an application to metallic substances of the old contrivance of 'goffering or crimping,' by means of which the frills of the olden time were made to keep their shape.

The sheets of metals are passed between rollers, the surfaces of which are formed into rounded grooves and ridges, the ridges of one roller filling the grooves of the other. The metal in passing between these is compressed into a waving form, or corrugated.

It will be easily understood that a piece of sheet-metal, of given size and thickness, if rolled up to form a tube, will resist a much greater bending strain than when flat. Now the curves of the corrugation may be regarded as a series of half-tubes, and the additional strength is due to the application of the same principle. See Strength of Materials. Walls and roofs of temporary buildings are now extensively made of this material. Railway sheds, emigrants' houses, temporary churches, store-rooms, and sheds for dockyards, &c., are among the common applications. Mr. Francis, of New York, has applied the principle to the construction of light boats, the strength of which, and their power of resisting violent blows, such as boats are subject to on landing through a surge, is said to be remarkably great. On this account, they are proposed to be used for life-boats, ships' boats, &c. They are made by stamping the metal in enormous dies, of the shape and size of the boat, and grooved for the required corrugations. Small boats thus constructed require no internal bracings, the requisite rigidity and strength being given entirely by the corrugations.

CORRU'PT PE'RJURY. See Perjury.

CORRUPT PRACTICES ACT. The laws relating to bribery, treating, and undue influence at elections of members of parliament, were consolidated and amended by 17 and 18 Vict. c. 102 (10th August, 1854), which was continued and amended by 21 and 22 Vict. c. 87 (2d August 1858). Both of these statutes were further continued till 10th August, 1860, by 22 and 23 Vict. c. 48, to 1861, to 1879, &c. New statutes were passed in 1863, 1867, 1868, 1880, and other years; indeed, additional legislation on this very troublesome subject has been attempted in almost every session of parliament. See Parliament.

CORRU'PTION OF BLOOD. See Treason.

CORRUPTION OF JUDGES. See Judge.

CO'RSAC (*Canis* or *Cynalopex Corsac*), an animal of the dog family (*Canidæ*), found in the deserts of Tartary and in India. In size, it resembles a small fox, but is more slender in body and limbs; it has long and pointed ears, a bushy tail, and is of a reddish or yellowish color; the form of the head resembles that of the fox. It lives in large communities, burrows, prowls during the day and not during the night like foxes, and is believed to feed chiefly on birds and their eggs, but not to object even to insect food. There are several Asiatic species closely allied to this.

CO'RSAIR (Ital. *corso*, a race), a pirate or sea-robber, but generally limited in its application to the pirates who in former times sailed from Algiers, Tunis, Tripoli, and the ports of Marocco, and were the terror of merchantmen in the Mediterranean and the neighboring parts of the Atlantic Ocean.

CO'RSICA, an island in the Mediterranean, separated from the island of Sardinia by the strait of Bonifacio on the south, and situated in lat. 41° 20′—43° N., and long. 8° 30′—9° 30′ E. It forms the French department of Corse, and has an area of 3350 square miles, with a population, in 1881, of 258,440. The greater portion of the island is occupied by ranges of rugged mountains, the highest being Monte Rotondo (ancient *Mons Aureus*), 9068 feet high, and covered with perpetual snow. There are several rivers in the island, the largest of which, having their source in Monte Rotondo, are the Tavignano (ancient *Rhotanus*) and the Golo (ancient *Tavola*). They flow into the sea on the east coast; the Gola is navigable for boats. Several small rivers, most of which are dry in summer, flow westward into the sea. The soil is generally fertile in the valleys, yielding all kinds of cereals, and much wine is produced. Olive, orange, fig, almond, and other fruit-trees flourish; fruit forming a considerable item in the exports. But C. is chiefly celebrated on account of its magnificent forests of oak, pine, chestnut, beech, larch, cork, &c. Many of the pines are upward of 120 feet high, and are much used for masts in the French navy. The chestnut forests are particularly fine, and the fruit serves as an important article of food for the inhabitants. Prickly-pear, arbutus, myrtle, &c., abound. Iron, lead, black manganese, antimony, marble, and granite of beautiful quality, are found on the island, but these sources of wealth are not developed. Sheep of a peculiar black breed, with four, and occasionally six horns, goats, and pigs are numerous, and the rearing of cattle is carried on to a great extent. Tunny, pilchard, and anchovy abound along the coast. C. is divided into the five arrondissements of Ajaccio, Bastia, Calvi, Corte, and Sartene. Ajaccio is the capital. The language spoken in C. is a corrupt Italian. The Corsicans are great *improvisatori;* valor, love of freedom, and desire of revenge are their principal characteristics.

In early times C. was known as *Cyrnos*, although its native name is said by some historians to have been the same as that it now bears. As early as 564 B.C., a colony of Phocæans had founded a city on its east coast. After successive changes of Carthaginian, Roman, Vandal, Greek, and Gothic rulers, it came in the 8th c. into the hands of the Saracens, who held it until the beginning of the 11th c., when it fell under the dominion of Pisa. It afterwards passed to the Genoese, who held it until 1755, when the Corsicans under General Paoli made themselves in great part independent. The French, to whom the Geonese surrendered the claims they themselves could not maintain, captured it in 1768; since which time, with slight intermission, it has remained in the possession of France.

CO'RSLET was the body-covering of pikemen. The C. was made chiefly of leather, and was pistol-proof.

CO'RSNED, or morsel of execration, was a piece of cheese or bread made use of in early times with a view to ascertain whether persons suspected of any crime were guilty or innocent. The C., according to Blackstone, 'was consecrated with a form of exor-

cism, desiring of the Almighty that it might cause convulsions and paleness, and find no passage, if the man was really guilty, but might turn to health and nourishment if he was innocent.' In this mode of divination, barley-bread appears to have had the preference. It was one of the many forms of ordeal (q. v.)

CO'RSO (literally, course or running) is an Italian word used to express not only the racing of horses (without riders), but also the slow driving in procession of handsome equipages through the principal streets of a town, such as almost always takes place in Italy on festivals. This custom has given a name to many streets in almost all the larger towns of Italy. The best known of these is the C. in Rome, which is the scene of the celebrated diversions of the Carnival.

CORT, CORNELIS, a famous Dutch engraver, was born at Hoorn in 1536. In 1572, he went to Venice, and was hospitably received there by Titian. Being less of a painter than of an engraver, he seems very soon to have been employed by the great Venetian colorist for the reproduction in copper-plate of some of his master-pieces; and it appears he did it so well, that he afterwards engraved for Tintoretto and other Venetian masters. C. next settled at Rome, where he erected an engraving school, and had among his pupils Agostino Caracci, and from this school sprang the most excellent Italian and Venetian engravers. C.'s works had a favorable influence on the graver's art in the Netherlands. He died at Rome in 1578. His engravings, considering his short life of 42 years, are very numerous amounting to more than 150.

CO'RTÉS, is the name given in Spain and Portugal to the assembly of representatives of the nation. As one district of Spain after another was recovered by the Christian princes from the Moors, there arose in each a corporation composed of the different 'States' or orders of the population, limiting the power of the princes. From the union of several of these territories were formed the two leading kingdoms of Castile and Aragon, having each its C., representing the clergy, the nobility, and the cities. In Aragon, the C. appointed a judge, *el justicia*, who decided disputes between the king and his subjects, and confined the royal power within constitutional limits. In Castile the rights of the burghers were less extensive than in Aragon, but in both states the king was dependent on the Cortes. After the union of Castile and Aragon under Ferdinand and Isabella, the crown succeeded in making itself less dependent on the C., whose power and privileges were gradually encroached upon, until at last they were seldom assembled except to do homage or to sanction an arrangement as to the succession to the throne.

After 1713 they did not meet till 1789, on the accession of Charles IV. In 1809, the C., as composed in 1789, was assembled by the Junta, and framed a new constitution, called the Constitution of 1812, which, however, was set aside at the restoration. Endless attempts at restoration and modification of the Spanish C. have since been made, without any happy result. See SPAIN.

The history of the Portuguese C. is very similar to that of the Spanish. In 1826, Dom Pedro promulgated a new constitution after the model of the French, calling the C. again into life, and abdicating at the same time in favor of his daughter, Maria de Gloria. This constitution was set aside during the usurpation of Dom Miguel, but was finally restored in 1842.

CO'RTÉS, HERNAN, the daring conqueror of Mexico, was born in 1485, at Medellin, a village of Estremadura, Spain. He was educated for the law, but afterwards adopted the profession of arms; and in 1511 distinguished himself under Diego-Velasquez in the expedition against Cuba. In 1518 the conquest of Mexico was intrusted to him by Velasquez, who was then governor of Cuba; but the latter had no sooner granted him the commission than he wished to revoke it, fearful that his dashing and sagacious lieutenant would deprive him of all the glory of the enterprise. C., however, maintained his command in defiance of the governor. Never, perhaps, was an enterprise so great undertaken with so little regard for its difficulties and dangers. A force of between 600 and 700 men, only thirteen of whom were musketeers, with only ten field-pieces and two or three smaller pieces of cannon, were all the means at C.'s disposal to effect the conquest of the then extensive empire of Mexico, when, early in 1519, he landed on its shores. Sailing up the river Tabasco, C. captured the town of that name, the prowess of the Spaniards occasioning great terror to the Tabascans, who made liberal presents to the white men, and volunteered all the information about Mexico in their power. Arriving off the coast of San Juan de Ulloa, C. was here visited by some Mexican chiefs, with whom he entered into negotiation regarding a visit to Montezuma, who then ruled with nearly absolute sway over Mexico. Montezuma sent C. rich presents, but objected to his visiting the capital. But C. had resolved upon seeing the emperor in his palace, and was not to be daunted by opposition. Having founded the town of Vera Cruz, and burnt his ships, so that his troops could not return, and must therefore conquer or perish, C., with a force reduced to 400 Spaniards on foot and 15 horse, but with a considerable number of Indian followers, lent him by dissatisfied chiefs dependent on Montezuma, marched upon the capital. Overcoming the Tlascalans, a brave people, on the way, who after became his firm allies, and taking fearful vengeance on the city of Cholula, where, by Montezuma's orders, a treacherous attempt was made to massacre his troops, C. on the 8th November 1519 reached the city of Mexico with his little band, and was received with great pomp by the emperor in person.

The Spaniards were regarded as those descendants of the sun who, according to a current prophecy, were to come from the east and subvert the Aztec empire—a tradition that was worth a good many soldiers to Cortes. An attack on C.'s colony at Vera Cruz by one of Montezuma's generals, however, proved the mortality of the Spaniards, and would have been the ruin of them but for the decisiveness of C., who immediately seized the emperor, and carrying him to the Spanish quarter, forced him to surrender the offending general and three other chiefs, whom he caused to be burnt in front of the palace, and ere long compelled him formally to cede his empire to Spain. One has nothing but astonishment for this man, whose daring acts in the capital city of the empire, containing, it is calculated, 300,000 inhabitants, had nothing but 400 Spaniards, and a few thousand Indians, whom he had recently conquered, to support them. Meanwhile Velasquez, enraged at C.'s success, sent an army of about 1000 men, well provided with artillery, to compel his surrender. C. unexpectedly met and overpowered this force, and secured its allegiance. But in his absence the Mexicans had risen in the capital, and C. was finally driven out with much loss. During the disturbance, Montezuma, who was still kept a prisoner, appeared on a terrace with a view of pacifying his people; but he was wounded by a stone, an indignity against his kingly person which he took so much to heart that he died in a few days. C. now retired to Tlascala, to recruit his fatigued and wounded men; and receiving reinforcements, he speedily subjugated all Anahuac to the east of the Mexican valley, and soon marched again on the city of Mexico, which he succeeded in capturing (August 16, 1521) after a siege of four months ended by a murderous assault of two days. Famine had assisted the Spanish arms, so that of the vast population only about 40,000 remained when the Spaniards entered the city, which lay in ruins, 'like some huge churchyard with the corpses disinterred and the tombstones scattered about.' Mexico was now completely subjugated, for though some attempts at revolt were afterwards made, they were soon crushed by C., who had been nominated governor and captain-general of the country by Charles V. In 1528, C. returned to Spain, to meet some calumnies against him, and was received with great distinction. On his return to Mexico in 1530, however, he was divested of his civil rank. At his own expense he fitted out several expeditions, one of which discovered California. In 1540 he came again to Spain, but was coldly received at court, from which he soon retired, and died at Seville, December, 1547.

CORTO'NA, a town of Central Italy, about 50 miles south-east of Florence. It is beautifully situated amid vineyards on a hill rising from the fertile valley of the Chiana, and commanding a view of the lake of Perugia (anc. *lacus Trasimenus*). The city is of fabulous antiquity, older, it is said, than Troy; and the Cyclopean walls, erected by the Pelasgians—which in many parts remain unchanged—prove, if not a history quite as old as tradition affirms, at all events one second in remoteness to few places in Italy. It was one of the most powerful of the twelve cities forming the Etruscan League. By the Romans, who settled a colony here about the time of Sulla, it was called *Corythus*. After many vicissitudes during the middle ages, the town became subject to Florence in the 15th century. Besides the walls, there are several objects of Etruscan antiquity at Cortona. The modern town contains above 3900 inhabitants. Among the principal buildings are the cathedral, dating from the 10th or 11th c., with some fine paintings and monuments, the churches of Jesus, St. Francesco, and others. The Etruscan Academy has its seat here, the museum connected with which contains a multitude of Etruscan sarcophagi, vases, &c. C. has a trade in wine and olives, and fine marble is found in the vicinity.

CORU'ÑA (English, *Corunna*), a fortified seaport of Spain, situated on a small headland in the Atlantic, formed by the three bays of Betanzos, Coruña, and El Ferrol, about midway between Capes Finisterre and Ortegal, in lat. 43° 22′ N., long. 8° 23′ W. C., which is a thriving place, is built partly on the slope and partly at the foot of a hill, and is divided into the upper and lower towns, the former being the most ancient. The lower town, which was formerly inhabited chiefly by fishermen, is now more important that the upper. It is well built, chiefly of granite, and some of its streets are broad and well paved. There are few public buildings of any note in Coruña. A citadel defends the town, and the harbor, protected by forts, is safe and commodious. The commerce of C. is considerable, not merely with the Spanish

ports, but with England and America. There are manufactures of cigars, soap, starch, and cotton; and sardine fisheries. Pop. (1877) 33,735. C. dates its origin from the Phœnicians, from whom it was taken by the Romans in the 1st c. B.C. For Englishmen, great historical interest attaches to Coruña. Here, in 1386, John of Gaunt landed to claim the crown of Castile in right of his wife, daughter of Pedro the Cruel; in 1554, Philip II. embarked here for England to marry Queen Mary; and in 1588 the great Spanish Armada, which had been refitted at this port, set sail for the conquest of England. But C. is best known in connection with the death of Sir John Moore, who, as a fitting conclusion to his memorable retreat, with about 14,000 men defeated (January 16, 1809) on the heights of Elvina, behind C., 20,000 French under Soult. Moore, who was mortally wounded in the action, was buried on the ramparts in his military cloak. A monument, erected by the British government, marks the place of his burial.

CORU'NDUM, a mineral consisting essentially of mere alumina, yet of great specific gravity—about four times that of water—and of remarkable hardness, being inferior in this respect only to the diamond. Mineralogists regard the sapphire as a variety of C., and along with it the gems popularly known as Oriental Ruby, Oriental Topaz, Oriental Emerald, and Oriental Amethyst; but the name C. is more usually limited to the coarser varieties, to which it is applied by the natives of India. These, instead of exhibiting the brilliancy of gems, are in general of a dull and muddy appearance, and the crystals—which are usually six-sided prisms, and six-sided pyramids—are externally dull and rough. The color is various, often green, blue, or red, inclining to gray. The variety called *Adamantine Spar* is of a hair-brown color and adamantine lustre. Some corundums—known as *Asteria Sapphires* or *Star Sapphires*—when cut in a particular manner, exhibit an opalescent star of six rays. C. is found in many parts of the world, and has long been used in India for polishing all gems except the diamond, which is too hard for it, and also for polishing the stones used in temples and other buildings. Emery (q. v.), so well known as a polishing substance, is a variety of corundum.

CORVEI (*Corbeia nova*), a Benedictine abbey on the Weser, near Höxter, the oldest and most famous in early Saxony, founded in the beginning of the 9th century. It was a colony from the monastery of the same name in Picardy, then part of the country of the West Franks. It received rich endowments; was the center of great agricultural improvement and prosperity during the earlier part of the middle ages; and the seat of a school, founded by Ansgar, the Apostle of the North, which flourished greatly in the 9th and 10th centuries, and was next in reputation to Fulda. Its abbots were numbered amongst the spiritual princes of the German empire. In 1794 it was made a bishopric by Pius VI. Its territory then extended to about 22 square miles, with 10,000 inhabitants. In 1803 it was annexed to Nassau, from which it was transferred in 1807 to Westphalia, and in 1815 to Prussia. In 1822 the lands belonging to the ancient abbey passed into the hands of Count Victor Amadeus von Hessen-Rheinfels-Rothenburg, which were formed into a mediate principality of the Germanic empire. The church of the abbey is built in the Gothic style, very magnificently adorned in the interior, and contains a multitude of monuments of successive dynasties. The library and archives of the cloister, which contained many valuable records of the early ages of German history, have all been destroyed—the authenticity of the *Chronicon Corbejense*, an alleged record of this abbey from its foundation to the end of the 12th c., being doubtful.

CORVE'TTE, is a flush-decked vessel, ship-rigged, but without a quarter-deck, and having only one tier of guns.

Corvette (20 guns).

CO'RVIDÆ, a family of birds of the order *Insessores*, tribe *Conirostres*, having a strong bill, compressed towards the point, and covered at the base with stiff, bristly feathers, which advance so far as to conceal the nostrils. The plumage is dense, soft, and lustrous, very generally dark, but sometimes of gay colors, more particularly in the tropical species. The birds of this family are widely diffused over the world. They are generally birds of strong and rapid flight; some of them are solitary, some gregarious in their habits; some reside in woods, some in moors and wastes, some on sea-coasts, &c. They are very omniverous. They are also remarkable for their intelligence, their prying curiosity, and their disposition to pilfer and secrete glittering articles. Besides the crows, raven, rook, and jackdaw, which belong to the genus *Corvus*, the magpie, jay, chough, and nut-cracker are included among the C. of Britain.

CO'RVO, the most northerly of the Azores, is the smallest among the inhabited islands of the group. It measures only 6 miles by 3, the latitude of its southern point being 39° 42′ N. It is of volcanic origin, and has, in an exhausted crater, a small lake 1277 feet above the sea. With a fertile soil and a delicious climate, C. contains barely 1000 inhabitants, and these generally poor.

CO'RWEN, a town in north Wales, in the north-east of Merionethshire, situated on the right bank of the Dee, 10 miles west of Llangollen. It is sheltered by a rock at the foot of the Berwyn mountains. Pop. of parish (1871), 2464. Here the Welsh under Owen Gwynedd defeated Henry II., and afterwards under Owen Glyndwr defeated Henry IV.

CORYDA'LIS. See FUMARIACEÆ.

CORYGAU'M, an insignificant village in the presidency of Bombay, is historically interesting in connection with the final subjugation of the Peishwa of the Mahrattas. On 1st January 1818, it was defended for nine hours by a mere handful of men under Captain Staunton against a native force numbering at least 3000 infantry aud about 20,000 cavalry, the struggle terminating in the repulse of the assailants after terrible slaughter. C. stands 16 miles to the north-east of Poona, in lat. 18° 39′ N. and long. 74° 8′ E.

CORYLA'CEÆ. See CUPULIFERÆ.

CO'RYLUS. See HAZEL.

CO'RYMB, in Botany, a form of *indefinite* and *centripetal* inflorescence, in which the flowers are arranged as in a raceme (q. v.), but the lower flower-stalks are elongated so as to bring the flowers almost to the level of those of the upper. The C. is a very common form of inflorescence.

CORYMBI'FERÆ. See COMPOSITÆ.

CORY'MBUS (Gr. *korumbos*), the particular mode of dressing the hair among the Greeks, with which the statues of Venus have rendered us familiar. The hair was often covered with a sort of open ornamental work.

CO'RYPHA. See FAN PALM, GEBANG PALM, and TALIPAT PALM.

CORYPHÆ'US (from Gr. *koruphe*, a summit), the leader of the chorus in Ancient Greece. The name is now used to signify those of the highest distinction in any art or science. In the Italian Opera the choir-leader is called the *corifeo;* in French, *coryphée*.

CO'RYPHENE (*Coryphæna*), a genus of fishes of the family *Scomberidæ*, to which the name DOLPHIN, properly belonging to a genus of *Cetacea*, has by some mistake been popularly transferred. The coryphenes are remarkable for the beauty and metallic brilliancy of their colors, which delight the spectator as they are seen gliding with extreme rapidity near the surface of the water, gleaming in the light of the sun; and the changes of which, as they lie dying on the shore or on the deck of a vessel, have acquired a peculiar poetic celebrity. They have an elongated compressed body, covered with small scales, the head rising in a sharp crest, the mouth large. They are natives of the seas of warm climates, and some species are found in the Mediterranean, among which is *C. hippuris*, the largest known, attaining a length of five feet. This and some of the other species are often seen playing around ships; and great interest is occasionally awakened by their pursuit of shoals of flying-fish. In this chase, a C. may be seen to dart completely out of the water, making a leap of ten yards or more. Captain Basil Hall likens the velocity to that of a cannon-ball. The C. is often caught by sailors, with a glittering bit of metal instead of a bait,

COS (more anciently, Meropis), an island of the Grecian Archipelago belonging to Asiatic Turkey. Its modern name is Stanko or Stanchio. C. has a length of 23 miles, with a breadth of 5, and a population of from 20,000 to 30,000, the half of whom are Greeks; the other half being Turks and Jews, who congregate in the towns. On the eastern side of the island a range of hills extends along the coast, from Cape Fonka on the north, to Point Korkilo on the south; but with this exception, C. consists mostly of delightful and fertile plains, which are well cultivated. South of these plains, on which stands the principal town, of the same name as the island, rises a high mountain range, which, from its jagged summit, is called Mount Prion—the 'sawing' mount or sierra. There are many mineral

springs on the island. The exports consist principally of raisins, lemons, salt, and grain. They amount annually to about £50,000. The chief imports are oil, soap, butter, butcher-meat, and English manufactures. The climate in general is pretty healthy. Many ancient Greek remains are scattered over the island. The chief town, Comopolis or Cos, is situated on the north-east coast. It is built on the ruins of the ancient city of the same name; and in the center of the chief street is a gigantic palm-tree, said to have stood there before the Christian era. To the north-west is an old fortress of the knights of St. John. The harbor is small, with only about 6 feet of water in it. The inhabitants are employed chiefly in agriculture. Modern Greek is the language spoken. In early times, C. was sacred to the worship of Æsculapius. It was the birthplace of Ptolemy Philadelphus, of the painter Apelles, and the physician Hippocrates.

COSCINO'MANCY, a species of divination practised from the earliest times by means of a sieve (Gr. *koskinon*) and a pair of shears or forceps. It appears to have been chiefly employed for the discovery of thieves. The sieve was supported or suspended by means of the shears, in some way not easily understood; a certain mystical form of words was then used, and the names of the suspected persons being mentioned in succession, at the name of the thief the sieve moved or turned round.

COSE'NZA, a town of Italy, capital of the province of the same name, about lat. 39° 20′ N., long. 16° 15′ E. It is situated 12 miles east of the Mediterranean, in a mountain-enclosed valley at the confluence of the Crati and the Busento, the waters dividing the town into two parts. The lower town is much affected by malaria arising from the river marshes, but the upper town is tolerably healthy. It is the residence of the principal families, and contains some handsome buildings, including a cathedral, and an unusually fine court-house. The streets generally are narrow and crooked. C. has considerable industry, the principal articles of manufacture being silk, earthen-ware, and cutlery. Pop. (1881) 16,686.

Anciently, C., called *Consentia*, was a city of the Brutii. It was captured by the Carthaginian general, Himilco, and was forced to surrender (204 B.C.) to the Romans, who afterwards colonized it. Alaric the Goth died here 410 A.D., and is buried in the bed of the Busento. Area of province (formerly called Calabria Citra), 3000 sq. m.; pop. (1881) 451,271.

CO-SINE, CO-TANGENT, &c. See TRIGONOMETRY.

CO'SMAS, surnamed *Indicopleustes*, a merchant of Alexandria, who lived in the middle of the 6th c., and after having traveled much, returned to Egypt, where he spent the evening of his days in monastic retirement, and wrote a 'Christian Topography' in 12 vols., in the Greek language, containing much information about many countries, and particularly about India. An attempt to reconcile everything to his notions of the meaning of the Bible has led him into many errors. The work (which, among other things, gives the first account of the *Monumentum Adulitanum*, see ADULE) has been edited by Montfaucon in the *Nova Collectio Patrum Græcorum*, vol. ii. (Par. 1707). C. wrote also a description of the plants and animals of India, which was published by Thevenot in his *Relations de Divers Voyages Curieux*, vol. i. (Par. 1666).

COSME'TICS (Gr. *kosmeo*, I adorn) are chemical preparations employed for improving the appearance of the skin and hair. Several of the C. in use are comparatively harmless, such as perfumed starch and chalk; whilst others, such as *pearl white* (the subnitrate of bismuth), are more or less poisonous, and dangerous to use. At all times the employment of C. is not to be commended, as the minute particles tend to fill up and clog the pores of the skin, and prevent the free passage of gases and vapors, which is so essential to the preservation of any animal organ in a thorough state of health.

COSMO DE' MEDICI. See MEDICI.

COSMO'GONY (Gr. *kosmos*, the universe, *gonè*, generation) is the (so-called) science of the formation of the universe. It is thus distinguished from cosmography, which is the science of the parts of the universe as we behold it (a science embodied in the work of Humboldt, entitled *Cosmos*), and from cosmology, which reasons on the actual and permanent state of the world as it is. Geogony, which confines itself to the formation of the earth, and speculative geology, are but subdivisions of cosmogony.

Cosmogonists proper may be divided into two classes—the Theistical, and the Pantheistical. According to Theistic C., the world of matter and order sprang at once into existence at the Omnific fiat. The chief speculations from this point of view, have of late been regarding the *date*, if the expression may be used, of the world's formation, and looking to the facts of geology and astronomy, the precise condition of the cosmos when evoked; how much, in short, of the evolution, since the date, is attributable to the operation of secondary causes. The Pantheists hold the universe, on the other hand, to be the very body and being of Deity, and as such to have been from all eternity. God is all things, and all things are God—a conclusion reached from pure *à priori* reasoning, and that seems to exclude all further inquiry.

Men of science in modern times, stopping short of an actual C. or genesis of the world, have pushed their inquiries into the order of development of its present state, which they, or at least some of them, aver to have taken place from the first by the divine power exercised in the manner of natural law. They assume the existence of matter; and with them there is no proper beginning of things, but an eternal round, under fixed laws of growth and decay.

In cosmogonical speculations, heat, air, atoms with rotatory motions, numbers—all in turn have had the honor of being recognized as the fountain and causes of things. Latterly, there has been a tendency to dynamical hypotheses, not only of the formation of our own rotating globe, but of our system, and of all similar systems in space. Of these, the chief is that of Laplace, founded on observation of the mutual relations of the planets, their common direction in rotation and evolution, their general conformity to one plane, &c.; taken in connection with such facts as the rings of Saturn and the fundamental unity of the asteroids. Thus arose the NEBULAR THEORY (q.v.), which at one time had a support from Sir William Herschel's observations on the *nebulæ;* of which, however, the discoveries by Lord Rosse's telescope in a great measure deprived it. Following up this view of a formation of the globes by natural causes, there have been speculations as to the commencement and progress of organic life upon them by similar means: these are to be found in the *Philosophie Zoologique* of Lamarck; the *Vestiges of the Natural History of Creation;* and in the work of Charles Darwin on the *Origin of Species by a Principle of Natural Selection*; all of which involve great differences of view among themselves, though all meeting in one point—an assimilation of the processes of creation to the ordinary natural course of things presumed to be arranged and conducted by the Deity.

CO'SMOS. See COSMOGONY.

COSNE, a town of France, in the department of Nièvre, and on the right bank of the Loire, here crossed by a suspension bridge. It has iron manufactures. Pop. (1876) 5711.

CO'SSACKS (Russ. *Kasak*), a race whose origin is hardly less disputed than that of their name. The latter has been variously derived from words meaning, in radically distinct languages, 'an armed man, a sabre, a rover, a goat, a promontory, a coat, a cassock, and a district in Circassia.' The C. are by some held to be Tatars, by more to be of nearly pure Russian stock. The most probable view is that they are a people of very mixed origin. Slavonic settlers seem to have mingled with Tatar and Circassian tribes in the regions to the south of Poland and Muscovy, in the Ukraine and on the lower Don; and to have given to the new race, first heard of as Cossacks in the 10th century, a predominantly Russian character.

On the conquest of Red Russia by Poland, numerous Russian refugees fled to the Cossack country; and more on the Tatar conquest of Muscovy. The numbers of the C. were also recruited from time to time by adventurers or fugitives from Poland, Hungary, Walachia, and elsewhere; but in physique, as in language and religion, the C. have always been mainly Russian. They distinguished themselves in war against Turks and Tatars, and were known as a powerful military confederacy in the 15th century. The kings of Poland and the czars of Muscovy employed them largely to defend their frontiers, especially against nomadic neighbors; but the connection between the C. and their lords paramount was always very elastic, and was frequently repudiated to suit the convenience of either party. The C. are still the outposts of Russian authority towards Siberia, Central Asia, and the Caucasus. Living near, or as 'free Cossacks' amongst, hostile peoples, the C. developed their peculiar military organization—either forming a cordon of military settlements along the confines of occupied territory, or as isolated camps in the nomad country beyond. Agriculture they eschewed; self-reliance and readiness at all times for defence or assault were their chief characteristics; though such of them as inhabited the banks of the Don and Dnieper, and their islands, became and still are skilful boatmen and fishers. Their political constitution was completely democratical; all offices were elective for one year only; and every Cossack might be chosen to any post, including the supreme one of Attaman or Hetman. This organization they have in great measure retained, though the office of Hetman was abolished by the Emperor Nicholas, except as a title hereditary in the imperial family. There have been two main branches of the C.—the Malo-Russian and the Don C. To the first belonged the Zaporogian C., those dwelling near the *Porogi* or falls of the Dnieper. From them again are descended the Tschernomerian C., those of the Kuban Valley and of Azov. From the Don C. spring those of the Volga or of Astrakhan, of the Terek Valley, of Orenburg, of the Ural, and of Siberia. They furnish a large and valuable contingent of light cavalry to the Russian army, and are very patient

of fatigue, hunger, thirst, and cold. The Don C. give name to a province with an area of nearly 60,000 square miles, and a population of over a million inhabitants (of whom 20,000 are Kalmucks). Though the C. have generally been represented in the west of Europe as little better than fierce savages, they have left a very favorable impression on those who have dwelt amongst them. Jonas Hanway found them in 1743 'a civilized, and a very gallant as well as sober people;' and many more recent travelers agree in asserting that the C. are in intelligence, cleanliness, refinement, and enterprise greatly the superiors of the average Russians. See Springer, *Die Kosacken* (1877), Wallace Mackenzie's *Russia* (1877), and an article in the *Geographical Magazine* for 1878.

COSSIMBAZA'R (*Cossim's market*), stands on the Bhagirathi, which is the first or most westerly offset of the Ganges, and is the river port of Moorshedabad. It was once famous for its silk manufactures. Pop. about 4000.

CO'SSUS. See GOAT-MOTH.

COSTA, ISAAC DA, an eminent poet and religious writer, was born at Amsterdam, January 14, 1798. His parents were Portuguese Jews, who had settled in Holland. The first aspiration of his poetical genius having been shown by his Hebrew teacher to Bilderdijk, the latter expressed himself favorably regarding it, and a warm and lasting friendship sprang up between him and Costa. In his twentieth year, C. acquired the degree of doctor at law; and shortly after, having embraced Christianity, was baptized. This subjected him to considerable persecution, which, however, subsided as his genius gradually gained recognition. The most interesting of his writings to the British public are probably his translation of Byron's *Cain*, his *Israel and the Gentiles*, and *Harmony of the Gospels*, the last two of which has been translated into English As a public lecturer, C. specially excelled. His *Battle of Nieuwpoort*, the last of his poems, is one of his masterpieces. He died April 28, 1860.

COSTA, SIR MICHAEL, a very popular musician and composer, was born at Naples, February, 1810. As he early showed a decided talent for music, he was sent to the Conservatoire in his native city for education, where he greatly distinguished himself. In 1828, his fame, though he was then but 18, having reached England, he was invited to take part in the Birmingham Musical Festival, an invitation he complied with; and he was so well received in this country that he resolved to settle in it. In 1830 he was appointed conductor of the music in the Italian Opera, London, an office which, in 1847, he resigned for a similar one in the Royal Italian Opera, Covent Garden. His great work, the oratorio *Eli*, produced at the Birmingham festival of 1855, raised him to a high rank as a composer. *Naaman*, first sung in Birmingham in 1864, was a great success. He was knighted by Queen Victoria in 1869; and, in the same year, received the Royal order of Frederick from the king of Würtemberg, in token of his Majesty's admiration of *Eli*, performed under the composer's direction at Stuttgart the previous November. C. is the author of several ballets, and of some operas, the most successful of which was *Don Carlos*.

CO'STA RI'CA, the most south-easterly state of Central America. It occupies the entire breadth from sea to sea between Nicaragua on the one side and New Granada on the other, stretching in N. lat. from 8° to 10° 40′, and in W. long. from 83° to 85°. With an area of 26,000 square miles, it is estimated to contain (1880) 185,000 inhabitants. The country is generally mountainous—more so on the north-east than on the south-west—with many volcanoes, the temperature becoming mild and salubrious in proportion to the elevation. It yields gold and silver, tobacco, sarsaparilla, indigo, sugar, cocoa, and dye-woods.

The principal staples, however, of foreign trade are coffee, hides, and cedar. These are exported chiefly from Punta Arenas, on the Gulf of Nicoya, an inlet of the Pacific Ocean. The other places of any note are San José, the capital, and the cities of Cantago, Alajuela, Eredia, Estrella, and Esparsa. The government is republican, the president being elected every four years. A notorious fillibuster, William Walker, put Costa Rica, some years ago, to much trouble commercially and politically. Estimated revenue in 1880–81, £475,000. In 1880, the imports amounted to £600,000, the exports to £750,000. The exports consist chiefly of coffee, of which upwards of 24,000,000 lbs. were exported in 1880. A railway from the Atlantic to the Pacific, by way of San José, is being constructed.

COSTE'LLO, LOUISA STUART, a voluminous English authoress, was born in 1815. Her first production, at least of any note, was *Specimens of the Early Poetry of France* (1835), but it was as a tourist she gained the greatest popularity. The works in which she describes her traveling-trips are—*A Summer amongst the Bocages and the Vines* (1840); *A Pilgrimage to Auvergne*, &c. (1842); *Béarn and the Pyrenees* (1844); *The Falls, Lakes, and Mountains of North Wales* (1845); and *A Tour to and from Venice by the Vaudois and the Tyrol* (1846). Miss C. also wrote several novels, the principal of which are *The Queen-mother* (1841), and *Jacques Cœur, the French Argonaut* (1847). In 1853, she published a work of a professedly historical character, entitled *Memoirs of Mary, the Young Duchess of Burgundy;* and in 1855, another of the same kind, *Anne of Brittany*. Miss C. wrote in a very pleasant and picturesque style. She died in 1870.

CO'STER, LAURENS JANSZOON, according to the Dutch, the inventor of printing, was born at Haarlem about the year 1370. The time of the invention ascribed to him must have fallen between the years 1420 and 1426. C., at first for his own amusement and the instruction of his grandchildren, cut letters out of the bark of the beech-tree, which he inverted, and employed to print short sentences. Afterwards, he discovered a more glutinous kind of ink, which did not spread in using, and succeeded in printing with it entire pages with cuts and characters. He also replaced his wooden types by types cast out of metal, at first using lead for this purpose, but afterwards pewter, which he found harder and more suitable. C., for a time, worked in secret, because, he being a sacristan, his art, if known, would have brought him into unpleasant collision with the manuscript-writing clergy, whose productions he tried to imitate, even to the abbreviations; thus his name did not appear on the productions of his press. As custom increased, C. had to take apprentices; and one of them, a German, Johann, making use of the confusion occasioned by C.'s death in 1439, is said to have purloined the greater part of his master's types and matrices, and to have fled to Mainz, where he brought the hidden art to light. This Johann was probably Johann Gänsfleisch, a member of the Gutenberg family.

Such, at least, is the history of the invention of printing as given by the Dutch, and which they support by the testimony of Hadrianus Junius, the historian of the states of Holland, who, in his account of the discovery, states that, at the time he wrote, C.'s descendants were in possession of drinking-cups made out of the remains of the types which C. had used. Moreover, a celebrated printer of Cologne, Ulrich Zell, deceased about the year 1500, is said to have declared 'that Gutenberg, *his master*, had derived his art from Holland, after the model of a *Donatus* printed there.' Now, a Donatus of C.'s time still exists; it was produced in 1740 by Johannes Enschedé, also a celebrated printer of Haarlem; and no sooner had his discovery been made known in Meerman's *Origines Typographicæ*, than fragments of the same work appeared in such quantities, that no one could any more aver that this early monument of imperfect typography, mostly printed from indisputably Dutch types, had been struck off from Gutenberg's press. Gutenberg's works even now, are models of impression; those ascribed to C., *at first printed on one side only*, are the first proofs of a beginner. Then, all the characters of the oldest Dutch printed books resemble the Dutch handwriting of the first half of the 15th c., a proof of the independent nature of the attempts towards imitating manuscripts for sale. Other evidences are given by the Dutch that C. was the true inventor of printing; the most eminent advocates of his claims being Meerman, Koning, Scheltema, Van Westreenen van Tiellandt, De Vries, Schinkel, Noordziek, Ebert, Leon de Laborde, Paul Lacroix, and Bernard. Yet the most thorough going assault on the claims of C. and of Haarlem, as being founded on local legends, was made in 1870 by a Netherlander, A. von der Linde. In the townhouse of Haarlem, the typographical remnants of the productions ascribed to C. are preserved. See PRINTING; and for the German account of the invention, GUTENBERG. As for C. his memory still is held in due honor by the town of his birth; the site of his house is still pointed out with pride; and monuments to his memory have been erected.

CO'STMARY (i. e., *cost*, or aromatic plant, of the Virgin Mary), or ALE-COST (*Balsamiti vulgaris*), a perennial plant of the natural order *Compositæ*, sub-order *Corymbiferæ*, a native of the south of Europe, which has long been cultivated in gardens in Britain for the agreeable fragrance of the leaves. The root-leaves are ovate, of a grayish color, on long footstalks; the stem is 2—3 feet high; the stem-leaves have no footstalk; the small heads of flowers are in loose corymbs, deep yellow. The leaves were formerly put into ale and negus, and are still used by the French in salads.

COSTRO'MA. KOSTROMA.

COSTS, the technical name in English law for the expenses incurred in legal proceedings. As a general rule, the C. of the successful party are paid by the loser, but the rule is subject to important exceptions. 1. A party suing or defending *in formâ pauperis* (to entitle him to which privilege he must swear that he is not worth £5), does not pay C., though he is entitled to receive them if successful. 2. In actions in which the plaintiff recovers damages under 40*s*., he is, in certain cases, not entitled to C., unless the presiding judge certifies that he ought to have them; and in all other cases, he is not entitled to them, if the presiding judge certifies that he ought not to have them. 3. A plaintiff who might have brought his action in the county court, is not entitled to C. if he sues in the higher courts, and recovers not more than £5

in certain actions, or £20 in others, unless the judge who tries the case certifies that it was proper the action should have been brought in the higher court. 4. A party who is successful in the main, and therefore entitled to the 'general costs,' may be unsuccessful upon some minor point, and therefore bound to pay the C. which belong properly to it. 5. A party who has tendered the amount recovered, and who pays the amount into court, and pleads the tender, is not bound to pay costs. 6. The payment of money into court in the course of an action relieves the party paying from C. of subsequent proceedings, if no greater amount be ultimately recovered.

C. formerly used to be given neither to nor against the crown, either in its fiscal, public, or private capacity; but by 18 and 19 Vict. c. 90, and 23 and 24 Vict. c. 34, the crown is now entitled to C., and bound to pay C. in the same way as a private suitor.

C. are taxed (i. e., the items allowed or disallowed) by the officer of the court appointed for the purpose under the name of the master. When so ascertained, they are, if in favor of the plaintiff, included in the amount for which judgment is given, if it be in his favor, and recovered as part of it. If they are in favor of the defendant, they are recovered as a judgment in his favor; and any party may have, if he chooses, his own attorney's or solicitor's bill taxed by the same officer before paying it, or even after payment in certain cases.

In criminal cases, the prosecutor's C. may be allowed by the judge, and in that case are paid out of the county rates, the county being reimbursed by the Treasury.

In Chancery suits, C. are, in the discretion of the court, given as a general rule to the successful party; but when the suit was properly instituted, and was of the nature of an administrative suit, C. are often given out of the estate.

C., in Scotland, are called Expenses (q. v.). See also AUDITOR OF THE COURT OF SESSION.

COSTU'ME (Ital. *costume;* Fr. *coustume, coutume,* from Lat. *consuetudo,* use and wont) is another form of the word custom, and, in its wider sense, signifies the external appearance which the life of a people presents at a particular epoch of its history. In its narrower and more usual sense, C. signifies the customary modes of clothing and adorning the person, in any particular age or country. In this sense, it includes the prevailing fashion in jewelry, weapons, and other personal equipments. In both senses, C. plays an important part in art. The poet, more especially the narrative or epic poet, is compelled to resort to it as a means of carrying his reader back into the age which he describes. Homer has it constantly in view in narrating the exploits of his heroes. Amongst modern romance writers, Sir Walter Scott has introduced the fashion of perhaps an excessive attention to mere external costume. But it is in art as presented to the eye, that C. becomes indispensable, and the loose and general treatment of it which is permitted to the novelist or the poet, is forbidden to the painter, the sculptor, and the player. How sorely the sculptor has been tried by the wigs and breeches of former generations, by the trousers, straps, hats, and other monstrosities of our own, no one who has seen a statue of Frederick the Great, or of the late Sir Robert Peel, can require to be told. Two means, not of solving but of escaping from the difficulty, have been largely resorted to: the one consists in departing from the modern dress altogether, and reverting to the ancient toga; the other, in wrapping up the figure, as far as possible, in a cloak. The first of these devices is neither more nor less than a deliberate violation of what artists regard as the laws of C., by which they conceive themselves bound to represent every object with its appropriate accessories; the second, besides being very often open in a lesser degree to the same objection, has the further disadvantage of accomplishing its object very imperfectly. The wisest course for the artist is boldly to face the difficulty. That he may do so successfully, many of the works of Rauch, Tieck, Thorwaldsen, Schadow, and others abundantly testify. In the earlier stages of art, an excessive attention to C. may generally be remarked, which though useless, and sometimes hurtful to artistic effect, has proved of the greatest value for historical purposes. The tendency of the earlier schools of art to exhibit C. with an almost painful accuracy and minuteness, is exhibited in the works of the older masters, both of the Italian and German schools. Even during the period of the highest bloom of Italian art, the medieval custom of representing historical, sacred, and ideal characters in the C. peculiar to the time and country of the artist, was in a great measure adhered to. From Paul Veronese, Tintoretto, and others, we may learn the aspect which a marriage-feast in the palace of a Venetian or Florentine grandee presented, but can form little conception of the C. of that simpler festivity in Cana of Galilee, or of that supper still less sensuous in Jerusalem, which they profess to represent. In the hands of the greater masters, these scenes assumed an ideal character; and in the works of Michael Angelo, Leonardo, and Raphael, C., though still exhibiting something of a native trace, rises into the highest regions of poetical conception. The effort to avoid anachronisms by a previous historical and antiquarian study of the subject, belongs, indeed, almost entirely to the modern European schools of art, and many painters of late have devoted themselves to it to such an extent as almost to forget that it is a means, and not an end, except, indeed, to a mere painter of clothes.

But it is in theatrical representations that attention to C., particularly in its narrower sense, becomes most imperative. When the stage, in Western Europe, commenced in the religious mysteries of the middle ages, the dress adopted was that which belonged to the time and the country. To this dress some fantastical object was generally added to indicate the character intended to be personated. In this position matters remained during the time of Shakspeare in England, of Lope de Vega and Calderon in Spain, and even of Corneille, Racine, and Molière in France. Whether a Greek, a Roman, an Assyrian, or a Turk was represented, the ordinary court-dress of the time was adhered to, and the turban, the helmet, or the laurel crown was placed on the top of the peruke or the powdered hair. In like manner, shepherdesses and peasant-girls had their hair dressed in turrets like feudal keeps, and long white kid-gloves which covered their hands and arms to to the elbow. Towards the middle of the 18th c., a reform was introduced by the famous actress Clarion, who acted Electra without hairpowder; but Talma was the first who introduced a C. really true to history. Garrick followed in the footsteps of the great Frenchman, though both he and Siddons, during their earlier period, personated the characters of Shakspeare in what has been called the rococo C.—knee-breeches and periwigs. Schlegel's *Hermann,* and Goethe's *Götz von Berlichingen,* were the first plays which were given in Germany with historical costume.

CO'STUS, or COSTUS ARA'BICUS, an aromatic much esteemed by the ancients, and concerning which great doubt long existed, but which seems now to be ascertained to be the dried root of *Auclandia Costus,* a plant of the natural order *Compositæ,* sub-order *Cynarocephalæ.* It is a native of the moist open slopes surrounding the valley of Cashmere. The roots are there burned as incense. They have a strong aromatic pungent odor, and are employed in protecting bales of shawls from moths.

CO'SWAY, RICHARD, a very noted painter in his day, was born at Tiverton, Devonshire, in 1740. He early displayed a taste for painting, and between his 14th and 24th year carried off five premiums from the Society of Arts. As a miniature-painter, he was particularly famous, and gained all the patronage of the nobility of his time. His works, in fact, were the fashion, and all attempts at rivalry were useless. Many of them were distinguished by great delicacy, correctness, and beauty, and his drawings were not unworthy of a place beside some of the old masters. The immense sums of money he made enabled him to live in the most sumptuous style, and to give musical-parties (his wife on such occasions being the principal performer), so far surpassing all other efforts of the kind that they formed a feature of the time, and were attended by all the rank, fashion, and intellect of that day. C. died in 1821.

COT, on shipboard, is an officer's hammock. It is made of canvas, in the form of a kind of chest, six feet long, two and a half wide, and one deep. This receptacle is kept out at full length by means of a square wooden frame. The bed or mattress is placed within the C.; and the arrangement is more comfortable than that of a sailor's hammock; but both are alike slung from the rafters or beams of the cabin.

COTE-D'OR, a department in the east of France, formed of part of the old province of Burgundy, in lat. 46° 55′—48° 10′ N., long. 4° 2′—5° 30′ E. It has an area of 3350 square miles, with a population, in 1881, of 380,548. The surface is in general rather elevated, and is traversed by a chain of hills forming the connecting-link between the Cevennes and the Vosges. A portion of that range, called the Côte-d'Or ('golden slope'), receives its name (which it gives to the department) on account of the excellence of the wines produced on its declivities. See BURGUNDY WINES. A great part of the department is covered with forests. The valleys and plains are fertile, and there is good pasture-land; but agriculture is in a backward state. C. is watered by the Seine, which rises in the north-west, and by several of its affluents; by the Saone, and by the Arroux, a tributary of the Loire. By means of canals, C. has water-communication with the German Ocean, Mediterranean, English Channel, and Bay of Biscay. The climate is temperate; iron, coal, marble, gypsum, and lithographic stones are found, the first in large quantities. C. is divided into four arrondissements; viz., Beaune, Châtillon-sur-Seine, Dijon, and Semur, with Dijon for a capital.

COTES, ROGER, a scientific man of much promise, was born at Burbage, near Leicester, July 10, 1682; but death cut him off on the high-road to fame ere he had attained his thirty-fourth year; not, however, before he had left some marks of his presence in the history of exact science. He was the author of the admirable pref-

ace explaining the Newtonian philosophy, and answering objections to gravitation, which was prefixed to the second edition (1713) of Newton's *Principia*. Various mathematical papers of his own, tending greatly to the development of logarithms, were published after his death. Short as his lifewas, his influence on mathematics is clearly traceable. He was held in the highest esteem by the scholars and scientific men of his time; and Sir Isaac Newton is asserted to have said of him that, had he lived, 'we should have known something.'

COTES-DU-NORD (northern coasts), a department in the northwest of France, forming a part of Bretagne, and bounded N. by the English Channel, in which are several small islands belonging to C.; lat. 48° 3′—48° 57′ N., long. 1° 53′—3° 35′ W.; area, 2650 sq. m.; pop. (1881) 619,632. The Armoric Hills, called also the Montagnes Noires, and the Menez Mountains, cross the department from east to west. They have a breadth of about sixteen miles, and consist chiefly of granite and clay-slate. These formations give a rude and broken aspect to the coast. The chief rivers, which are short but navigable, are the Rance, Gouet, Trieux, Guer, and Arguenon.

The southern district has the advantage of a considerable length of the canal between Nantes and Brest. Though a great portion of the south and the higher plains is occupied by heath and woods, there are, here and there, fertile spots; and in the north the influence of the neighboring sea is favorable to vegetation. The cultivation of flax and hemp, with pasturage and iron-mining, supply employment in the mountainous districts; while in the sheltered valleys and on the coast-levels all European kinds of grain, with pears and apples and other fruits, are produced; and maize is cultivated, but does not always ripen. The coasts are well supplied with various kinds of fish. The department is divided into the five arrondissements of St. Brieuc, Dinan, Loudéac, Lannion, and Guingamp. The chief town is St. Brieuc.

CO'TESWOLD, or COTSWOLD HILLS, a range of oolitic and lias hills, running through the middle of Gloucestershire, from Chipping Camden in the north-east, by Cheltenham and Stroud, to near Bath in the south-west. They are parallel to the Avon and Severn and separate the lower Severn from the sources of the Thames. They are 45 miles long, and in some parts 8 broad, and cover 312 square miles, with an average height of 500 to 600 feet. The highest points are Cleave Hill, 1134 feet, and Broadway Hill, 1086 feet. The soil is a clayey loam, with gravel and stone-brash. The surface is generally bare, with little wood; corn, turnips, and sanfoin are grown, and coarse-woolled sheep fed on them. At Stroud, they are crossed by the Thames and Severn Canal, and the Swindon Junction Railway.

COTHEN, or KOTHEN, an ancient town in the duchy of Anhalt, on a tributary of the Saale. Sugar from beetroot is largely manufactured here; spirits are distilled; and there is a trade in wool and corn. Brown coal is found in the neighborhood. Pop. (1880) 16,155.

COTHU'RNUS. See BUSKIN.

COTICE, or COST, in Heraldry, one of the diminutives of the Bend (q. v.).

COTI'LLON (Fr., under-petticoat), the name of a brisk dance, of French origin, performed by eight persons. The quadrille, which superseded it, is only a new variety of the cotillon.

COTINGA (*Ampelis*), a genus of birds of the family *Ampelidæ*, or Chatterers (q. v.), having a rather feeble and deeply-cleft bill, and feeding both on insects and fruits. They are natives of South America, inhabit moist places, and are remarkable for the splendor of the plumage of the males during the breeding season. Azure and purple are then their prevalent colors. During the rest of the year, they are clothed in a tame gray or brown.

COTONEASTER, a genus of plants of the natural order *Rosaceæ*, sub-order *Pomoceæ*, having polygamous flowers; a top-shaped calyx, with five short teeth; five small, erect petals; erect, short stamens; and a top-shaped fruit, the nuts of which adhere to the inside of the calyx, but do not cohere in the center. The species are pretty numerous, shrubs or small trees; some of them evergreen; with simple undivided leaves, more or less woolly beneath; small flowers in lateral cymes; and small fruit not agreeable to the palate, but the bright color of which, and its remaining on the tree in winter, make them very ornamental. *C. vulgaris* is a deciduous species, a native of hills in Europe and Siberia, and said to be found wild in a single locality in Wales. *C. tomentosa* is also found in the Alps. Most of the species are natives of mountainous parts of Asia; they are sufficiently hardy for the climate of Britain, and have become among the most common of our ornamental shrubs. Some of them, as *C. rotundifolia* and *C. microphylla*—both from the north of India—are much used for covering walls.

COTOPA'XI, the loftiest active volcano in the world, is in Ecuador, in the eastern chain of the Andes, and about fifty miles south of the equator. Humboldt gave the height at 18,880 feet; Reiss, the first to ascend it (in 1872) found it to be 19,500 feet above the sea. The valley at its foot, however, is itself 9000 feet high. The upper part of C., a perfect cone of 4400 feet, is entirely covered with snow, save that the verge of the crater is a bare parapet of rock. Whymper, who ascended in 1880 to the edge of the crater, gives the height as 19,600 feet. Below the snow is a well-marked barren belt covered with lichens and shrubs, below which again is forest. Smoke issues from the summit; sounds as of explosions are occasionally heard; and above, a fiery glow is often visible by night. Lava rarely flows even during eruptions, but flame, smoke, and immense volumes of ashes are then ejected; and when the heat melts large masses of the snow lying on the sides, destructive floods are occasioned in the valleys beneath. The first eruption recorded was in 1533. Others followed in 1698, 1743, 1744, and 1768, the most terrible of all. On the latter occasion ashes were carried 130 miles distance, and thickly covered an extensive area. C. was quiet till 1851. In 1854, 1855, and 1856 there have again been eruptions of more or less violence.

COTRO'NÉ, a town of Italy, in the province of Catanzaro, built on a point of land projecting into the sea, in lat. 39° 7′ N., long. 17° 10′ E. It is almost surrounded by the Esaro (ancient Æsarus), which here has its embouchure. C. is very strongly fortified. Its streets are dark and narrow, and its port of no importance; pop. above 7000. C., however, possesses interest from its antiquity and its historic associations. It owes its origin to a colony of Achæans, as far back as 710 B.C., its ancient name being Croton or Crotona. It soon became prosperous, wealthy, and powerful. Its walls measured 12 miles in circumference, and the territory over which it extended its sway was considerable. Its inhabitants were celebrated for athletic exercises, and they carried off most of the prizes at the Olympic games. Milo was its most renowned athlete. Pythagoras settled here about the middle of the 6th c. B.C.; but the influence which, by means of a league of his formation, he exercised, became obnoxious to the citizens, and he was expelled. About 510 B.C., C. sent forth an army of above 100,000 men to fight the Sybarites, who were utterly defeated, and their city destroyed. The war with Pyrrhus completely ruined the importance of C., and in the 2d c. B.C. it had sunk so low, that a colony of Romans had to be sent to recruit its well-nigh exhausted population. It never afterwards recovered its prosperity. Some ruins belonging to the old, exist in the vicinity of the modern city, the most important of which is a Doric column, part of a once magnificent temple to Juno, on Cape Colonne or Nau (the Naus of the ancients).

COTTA, the name of a very old German publishing-house, established at Tübingen in 1649, and still one of the most flourishing in Germany. The family came from Italy about the beginning of the 15th century. Its most prominent member was Joh. Friedr., Freiherr von C., a meritorious theologian of the 18th century.

JOH. FRIEDR., FREIHERR VON C., one of the most eminent publishers that Germany ever produced, was born at Stuttgart, 27th April 1764. He was educated at the university of Tübingen, and for some time practised as an advocate. In 1787, he undertook to conduct the family book-trade at Tübingen, and in 1795 he established the *Horen*, a literary journal, under the editorship of Schiller. In the same year, he commenced two larger periodicals, the *Politischen Annalen*, and the *Jahrbücher der Baukunde*. In 1798, he established the *Allgemeine Zeitung*—still published at Augsburg—the *Almanach für Damen*, and other works of a similar kind. C. now began to publish the works of the illustrious modern authors of Germany, such as Goethe, Herder, Fichte, Schelling, Jean Paul, Tieck, Voss, Therese Huber, Matthisson, the Humboldts, Joh. von Müller, and Spittler.

Besides the periodicals already mentioned, C. established the *Morgenblatt* and the *Literaturblatt*, and carried on the *Kunstblatt*, founded by Schorn. In 1810, he went to live at Stuttgart. The nobility of his family, which dated far back, was confirmed in his person under the title of Freiherr C. von Cottendorf. In 1824, he introduced the first steam-press into Bavaria, and, shortly after, founded at Munich the Literary and Artistic Institute. He died 29th December 1832. C.'s political principles were liberal, but temperate. In the diet of Würtemberg, and afterwards as president of the Second Chamber, he was always the fearless defender of constitutional rights. In manners, C. was simple and pure; and although covered with titles and orders from different governments, he had neither the pride nor the selfishness of a hereditary patrician. The first Würtemberg proprietor who abolished servitude on his estates, C. also furthered the interests of his farmers by building model-farms, and by setting an example in all rural improvements.

CO'TTAGE, a small dwelling-house, detached from other buildings, and usually of one story in height. Originally applied to a humble order of dwellings in the country, the term C. now embraces a wide variety of structures, from the cottage *orné* of the

French, to the simple but not unattractive cabin in the English rural districts, and the mountain *chalet* of Switzerland. In England, where universal security enables the people to establish dwellings in retired and picturesque situations, the building of cottages has been brought to great perfection; and it may be said with truth, that in no country in the world are there to be seen such a variety of beautiful cottages, scrupulously clean and neat in the interior, and ornamental exteriorly with flowers, shrubs, and bright green lawns. The different styles in which this class of houses may be built, are well described in the elaborate work of J. C. Loudon, on *Cottage Architecture*. The subject of proper C. accommodation, as regards the laboring peasantry of England and Scotland, has lately engaged serious attention. See papers in the *Transactions of the National Association for the Promotion of Social Science*. The best methods of keeping cows, pigs, poultry, bees, &c., are ordinarily described under the comprehensive title of C. economy. See Cobbett's *Cottage Economy*, also *Chambers's Information for the People*.

CO'TTBUS, or KO'TTBUS, a town of Prussia, in the province of Brandenburg, situated on the Spree, about 70 miles south-east of Berlin. It is an ancient place, surrounded by walls, and it has an old castle with towers, a royal palace, a gymnasium, and manufactures of beer, woollens, linen, leather and tobacco. Pop. (1880) 25,584.

COTTIN, SOPHIE, a very popular French authoress, was born at Tonneins (Lot-et-Garonne) in 1773. Her maiden name was Ristaud. Educated at Bordeaux, she was married when only 17 to M. Cotton, a Parisian banker, who left her a widow at the age of 20. From an early period she had exhibited a love of literature; and to cheer the solitude of her affliction (for she had no children), she now betook herself to the composition of verses, and even ventured on a lengthy history. But it was in fiction she was destined to win unfading laurels. In 1798, appeared *Claire d'Albe;* in 1800, *Malvina;* in 1802, *Amélie Mansfield;* in 1805, *Mathilde;* and in 1806, *Elizabeth, ou les Exilés de Sibérie*, a work which has been translated into most European languages, and has always been extraordinarily popular with the young. Madame C. died 25th August 1807.

CO'TTON, an important vegetable fibre, extensively cultivated in various parts of the globe within the 35th parallels of latitude.

1. *Botanical and Commercial Classifications.*—C. is the produce of all the species of the genus *Gossypium*, which belongs to the natural order *Malvaceæ*, and is thus allied to Mallow, Hollyhock, Hibiscus, &c., the general resemblance to which is very apparent both in the foliage and flowers. The species are partly shrubs, partly herbaceous, and either perennial or annual; they are natives of the tropical parts of Asia, Africa, and America, but their cultivation has extended far into the temperate zones. They all have leaves with three to five lobes, which, in a very young state are often sprinkled with black points, and rather large flowers, which are mostly yellow, but sometimes in whole or in part purple; the flowers very soon fall off; they grow singly from the axils of the leaves, and are surrounded at the base by three large, heart-shaped, cut or toothed, involucral leaves or bracts, partially growing together as one. The fruit is a 3—5-celled capsule, springing open when ripe by 3—5 valves, and containing numerous seeds enveloped in C., which is generally white, but sometimes yellow, and issues elastically from the capsule after it has burst open. The figure represents a species of C. plant found in India, and shows the manner in which the C. escapes from the capsule. Some of the other kinds have the flowers larger in proportion, and the leaves divided into more numerous and much deeper and narrower lobes, but the general appearance of all is very similar.

Cotton (*Gossypium tricuspidatum*).

Difference of opinion exists amongst botanists as to the number of distinct species, and there are very many varieties in cultivation, the number of which, through climatic influences and other causes, is continually increasing; but there are certain leading peculiarities on account of which some botanists and practical farmers reduce all, at least of the cultivated kinds, to four primary species—viz., 1. *Gossypium Barbadense;* 2. *G. Herbaceum* or *Indicum;* 3. *G. Peruvianum;* and 4. *G. Arboreum*. The produce of the first species is the most valuable. The beautiful long-stapled silky wool known as 'Sea Island' is a variety, and is grown exclusively upon the islands and a portion of the mainland of Georgia, South Carolina, and Florida; the saline ingredients of the soil and atmosphere being indispensable elements of the growth. The plant bears a yellow flower, and the seeds are small, black, and quite smooth, and the wool is easily separated therefrom; but when sown far inland, away from the saline influences of the coast, the seeds increase in size, and become covered with innumerable short hairs. A large percentage of the crops raised in Alabama, Louisiana, Mississippi, Texas, &c., are also varieties of this species, though owing to climatic influences, the wool is shorter in staple, and less easily separated from the seeds than Sea Island. The commercial value of the latter kind varies from 1*s.* 5*d.* to 3*s.* per lb., rare specimens sometimes realizing 5*s.* or 6*s.* per lb. The better description of Egyptian cotton belong to *G. Barbadense*, and bring 1*s.* to 2*s.* 6*d.* per lb. in the Liverpool market. The short-staple varieties, known as New Orleans, Mobile, &c., sell at from 5*d.* to 10*d.*, extra qualities sometimes bringing 1*s.* per pound. *G. herbaceum* is found in India, China, Egypt, &c. The principal commercial varieties are those known as Surat, Madras, and short-stapled Egyptian. It is a small shrubby plant, bears a yellow flower, the seeds are covered with short grayish down, and the staple produced, though not long, is very fine. Its price varies from 3½*d.* to 9*d.* per lb. A variety is cultivated in the United States, and the C. known as nankeen is thought to belong to this species. *G. herbaceum* can be profitably cultivated in colder countries than any other species of C. plant. The third species is a native of South America, and the 'green seed' C. of the United States appears to be a variety. The stem reaches 10 to 15 feet in height, the flowers are yellow, and the capsules contain eight or ten black seeds firmly attached together in a cone-like mass. The wool is long and strong-stapled, and in value stands next in order to Sea Island and long-stapled Egyptian. Maranham, Bahia, and Maceio are varieties which sell in Liverpool at from 8*d.* to 1*s.* 2*d.* per lb. *G. arboreum* is found in India, China, &c., and, as its name imports, is a large tree-like plant. It bears a red flower, and produces a fine yellowish-white wool. Varieties of it have been long cultivated in the United States, and with the requisite soil and climate, are said to produce a wool somewhat resembling Sea Island.

2. *Cultivation.*—The plant is a very delicate organism, and requires a peculiar soil and climate for its due development. The method of cultivation is much the same in the various countries where the fibre is grown; but the most perfect system is that which obtains in the United States of America. Although the plant is not, strictly speaking, an annual, it is found more profitable to destroy the shrub, after the crop is gathered, and sow new seed every year. The preparation of the land takes place during the winter-months. After the ground has been thoroughly ploughed, and as soon as all symptoms of frost have disappeared, the soil is laid off into rows varying in width from 3 to 4 feet, according to the situation and quality of the soil. The seed is then sown along the center of the beds in a straight furrow made with a small plough or opener; but in some plantations the seed is sown in holes from 12 to 18 inches apart. The sowing commences in March, and generally continues through April; but sometimes, owing to late spring frosts, the planting is prolonged to May. The young shoot appears above ground in about eight to ten days, and is then and subsequently weeded and thinned. Blooming takes place about the beginning of June—in early seasons, towards the latter end of May; the average date is about June 5. As a general rule, C. is a dry-weather plant. For ploughing, the planter requires just sufficient rain to give the soil a moist and spongy texture. During the early stages of its growth, the crop flourishes best with a warm steamy sort of weather, with an occasional shower until blooming; too much rain being productive of weeds and wood at the expense of wool, whilst a severe drought produces a stunted plant, forced into too early maturity, and resulting in a small and light-stapled crop. A great deal, however, depends upon the position of the plantation; lands situated in hilly or upland districts obviously requiring more moisture than those lying in the plains and river-bottoms. From the date of blooming to the close of the picking season, warm dry weather is essential. Picking generally commences in August, occasionally in July, and continues until the occurrence of frost—about the end of October or beginning of November—puts a stop to the further growth of the plant. All the available hands of the plantation, young and old, are called into full employment during the harvest. The C. is gathered into baskets or bags suspended from the shoulders of the pickers, and when the crop has been secured, it is spread out and dried, and then separated from the seeds. The latter process was formerly performed by hand—a tedious operation, by which one hand could clean only a pound or so a day; but since the invention of the saw-gin, by Eli Whitney in 1793, the process of cleaning has been both rapid and effectual.

This machine is composed of a hopper, having one side formed of strong parallel wires placed so close together as to exclude the passage of the seeds from within. The wool is dragged through the apertures by means of circular-saws attached to a large roller, and made to revolve between the wires, the seeds sinking to the bottom of the hopper. This process is adopted only in cleaning the short-stapled varieties of American C., the seeds of which adhere so firmly to the wool as to require a considerable amount of force to separate them. The Sea Island variety is cleaned by being passed through two small rollers, which revolve in opposite directions, and easily throw off the hard smooth seeds. In India, though the saw and other machine-gins have been introduced in some districts, the wool is mostly cleaned by means of a primitive roller. Both descriptions of gins are used in Egypt and Brazil. The C. cleaned by the roller-gin, being uninjured thereby in staple, realizes the better price; but the deterioration caused by the saw-gin is compensated for by the greatly increased quantity cleaned; the latter turning out four or five times as much work as the former in an equal space of time, and thereby considerably reducing the expense of cleaning. The introduction of improved gins has very largely increased the production of cotton in Egypt and Brazil during the past fourteen years.

3. *Production and Distribution.*—The oldest C.-producing country is India, in which empire the plant has been grown and manufactured from time immemorial. Early mention is also made of it in the annals of Egypt, and it is believed to have a high antiquity in all parts of Africa. In the western world, it was found by Columbus, but was not so extensively cultivated as in the East; though during the past half-century the culture there has outstripped, both in quantity and quality, the produce of the Old World. Down to the commencement of the present century, the C. consumers of Europe were dependent upon the East and West Indies and the Levant for their raw material; but the inventive genius, superior farming, and greater energy of the planters of the Southern States of America, had, prior to the civil war, almost secured the monopoly of supplying the manufactures of Great Britain and the European continent with this valuable fibre. The average import of American cotton into Great Britain in 1858—1860 reached 79 per cent. of the entire arrivals; during the war the proportion fell to 3½ per cent.; but in 1871, it rose to 58 per cent. We will glance briefly at the history of the trade of the chief C.-growing countries.

United States.—The introduction of the plant is traced as far back as 1536, but the export trade did not commence until two and a half centuries later, the first shipment of importance being about 2000 lbs. in 1770. In 1791, the amount reached 189,316 lbs. In 1793, the invention of the saw-gin gave a new stimulus to the trade, and in 1800, the exports reached 17,789,803 lbs.; from which period the shipments have continued to increase, being over 124,000,000 lbs. in 1821, to 277,000,000 lbs. in 1831, 530,000,000 lbs. in 1841, 927,000,000 lbs. in 1851, and about 2,160,000,000 lbs. in 1860. Simultaneously with this rapid increase in production, there was, down to 1851, a gradual decline in the price of the wool, in consequence of improved processes of cultivation and cleaning, and the cheapening of carriage, &c.; the average price in Liverpool, in 1793, being 1*s.* 6*d.* per lb.; in 1801, 2*s.* 2*d.*; in 1811, 1*s.* 2*d.*; in 1821, 9½*d.*; in 1831, 6*d.*; in 1841, 6¼*d.*; in 1851, 5¾*d.* per lb.; from which period, however, the downward course was not only checked, but a movement in the opposite direction commenced, the average for 1856—1861 being 7*d.* per lb.; the low prices current having caused consumption to overtake production. The outbreak of the civil war in 1861, and its continuance until 1865, completely revolutionized the industry of the South. The abolition of slavery added materially to the cost of producing cotton; and this circumstance, along with the general rise which has taken place in values of all kinds during the past twelve or fifteen years has raised the price at which it will pay to sell American cotton in Liverpool to nearly 8*d.* per lb., against an average of 7*d.* per lb. for the five years ended with 1861. During the war, middling Orleans touched 2*s.* 7½*d.* per lb. In 1867 (December), there was a decline to 7⅜*d.*—every one expecting a return of old prices; within a few months there was a reaction to 1*s.* 1*d.* Since then the tendency has been downwards; the average for 1875 being 7⅜*d.*, against 8*d.* in 1874, and 9*d.* in 1873.

The following table is interesting as showing the wide fluctuations which have taken place in the exports of cotton from the United States during the 12 years ending in 1871 expressed in millions of lbs.

	Weight, lbs.	Average Price, cents.		Weight, lbs.	Average Price, cents.
1859—60.....	1767·6	10·85	1865—66....	650·6	43·24
1860—61.....	307·5	11·07	1866—67....	661.5	30·1
1861—62.....	5·0	23·30	1867—68....	784·3	19·2
1862—63.....	11·4	58·43	1868—69....	644·3	24·9
1863—64.....	10·8	83·43	1869—70....	900·4	23·4
1864—65.....	6·6	86·58	1870—71....	1462·9	14·8

In 1871—1872 there was a reduction to 933,000,000 lbs., owing to a failure of the crop. In 1874—1875 the weight exported was about 1,178,700,000 lbs.; in 1878–79, 1,628,400,000 lbs., and in 1879–80, 1,822,000,000 lbs.

STATEMENT OF THE PRODUCTION, DISTRIBUTION, AND AVERAGE PRICE OF FIFTY CROPS (1826—75) OF AMERICAN COTTON, ACTUAL AND PROPORTIONAL, IN AVERAGE PERIODS OF FIVE YEARS EACH (EXPRESSED IN THOUSANDS OF BALES).

Periods of Five Years.	Average Produce of							Average Total Crop.	Proportional Produce of							Average Exports to				Average Consumption of the U. S. (*N. of Virginia, only*). 1871—75	604	375	469	14	329	1939		3730	16½	10	12⅜	⅜	8¼	52		1898	261	507	2666	1062	85	3727	50⅞	7	13⅝	28½	—	—

The figures between 1861—1865 were disturbed by the war. Down to within a few years before the war, the bulk of the crops grown in the various states were shipped at the several ports of each state—Alabama C. at Mobile, Georgia C. at Savannah, and so on; but the more general introduction of railways has diverted a great deal of C. from the old channels. The increase under the head 'N. Carolina and Virginia' is owing almost entirely to this cause. One of the most remarkable features in the last line of the above table is the large proportionate increase in the consumption of the United States.

Cotton seed is remarkably rich in oil, now used for a variety of purposes. The crop of C. seed in the United States amounts to about 3,000,000 tons, or 180,000,000 bushels; in 1881, the oil-mills consumed 180,000 tons in the manufacture of C. seed oil, while less than half of the remainder was used for fertilizers, for seed, and for feeding stock (the balance being totally lost). C. seed cake or

meal is especially rich in nutritious matter for farm-stock, causing cattle to fatten rapidly, and producing very rich milk (though the butter is not improved). Boiled C. seed, with hay or straw, is admirable feeding. The oil is found to be admirable for culinary purposes, and is said to be equal to the best lard.

East Indies.—After the United States, the most extensive C. producing country is India. The plant is indigenous to the soil, and the culture and manufacture have existed from prehistoric times. A century ago, the western world was almost entirely dependent upon the east for its C. goods, but within the past one hundred years the order of things has been almost reversed. The mills of Lancashire are now in successful competition with the famed looms of India, and the natives of that vast empire find it cheaper to take our calicoes in exchange for their raw C., than it is to manufacture their own clothing. The first import of East Indian C. into Great Britain took place in 1783. The average receipts, from that year to 1792, were 65,550 lbs.; from 1793 to 1800, 2,223,039 lbs.; 1801 to 1810, 6,357,000 lbs.; 1811 to 1820, 24,016,805 lbs.; 1821 to 1830, 18,835,567 lbs.; 1841 to 1850, 79,815,403 lbs.; and 1851 to 1859, 23,017,310 lbs. In 1820, only 224 pounds-weight of C.-yarn, and 14,191,177 yards of goods, were exported to India; but in 1880, the figures, including shipments *viâ* Suez, were 44,000,000 lbs. yarn, and 1,670,000,000 yards of calico! It is impossible to ascertain the total amount of C. raised in India; but we may observe that the fibre is grown all over the peninsula, and is used for all purposes for which we employ C., flax, wool, and mostly hemp. The following figures will give the reader some idea of the extent of the export branch of the trade; they also show the marvelous expansion incidental to the American war.

WEIGHT AND VALUE OF COTTON EXPORTED FROM INDIA.

	lbs.	£		lbs.	£
1857,	319,653,524	4,437,949	1866,	803,150,424	35,587,389
1860,	345,953,569	5,637,624	1869,	691,196,905	19,778,924
1863,	473,678,421	18,779,040	1872,	809,246,087	21,272,430

Prior to the American war, the supply of C. from India was merely supplementary to that from the United States. With a small crop in America, prices advanced, and the imports from India increased; but with a large American yield, prices drooped, and the receipts from India fell off; the surplus produce finding its way to China, or being consumed in the interior. This is in a measure still the case (as is shown in the above figures), though not to the same extent as formerly. By the introduction of improved methods of cultivation, cleaning, &c., the quality of Indian C. has been greatly improved; and it is now much more generally used than it was twelve or fifteen years ago.

Brazil.—The C. trade of Brazil has undergone a most extraordinary development during the past ten years, owing to the impetus given to the cultivation of the plant during the American war, and to the general adoption of the saw-gin in place of the roller-gin; this substitution of the American gin has produced quantity at the expense of quality; but the demands of fine spinners have been met by increased supplies from Egypt. The subjoined statement shows the progress made by this branch of Brazilian trade:

IMPORT OF BRAZIL COTTON INTO EUROPE.

	Bales.		Bales
1831—1835, average....	175,000	1861—1865, average....	201,000
1841—1845, "	105,000	1866—1870, "	614,000
1851—1855, "	149,000	1871—1874, "	723,000

Egypt.—The C. plant has been known in Egypt from time immemorial; but the trade, properly so called, was first introduced by the celebrated Mehemet Ali, about fifty years ago. The first exportation took place in 1821, and amounted to 944 cantars. During the seven years ending 1827, 1,011,697 cantars were produced, or 144,528 cantars per annum. In the next septennial period, there was a falling off, owing to the withdrawal of a large number of laborers to carry on the wars of the pasha in Soudan, &c., and Syria; the exports therefore only reached 900,521 cantars, or 128,646 per year. The transactions of the subsequent seven years show a considerable improvement, the total shipments being 1,498,042 cantars, and the annual average 214,006 cantars. During the years 1842—1848, the total rose to 1,549,909 cantars, being an annual average of 221,415 cantars. Since then, the trade has continued to augment. The average shipments of the years 1849—1859 were 473,282 cantars. The cantar is equal to 94 lbs., and there are about 5½ cantars to the bale of the present (1873) average size; so that the exports in 1849—1859 represented 86,000 bales per annum. In 1865, the shipments reached 406,000 bales; in 1875 they amounted to 347,000 bales—or 2,020,000 and 1,908,000 cantars respectively. Great Britain is the principal consumer of Egyptian C., after which comes Austria, then France. The following figures show the destination of the C. exported from Alexandria during the six years ending September 30, 1875.

EXPORTS TO

	England.	France and Spain.	Austria and Italy.	Total.
1870	177,631	26,356	26,735	230,722
1871	246,513	14,974	25,391	313,878
1872	274,921	22,577	43,967	341,465
1873	299,062	35,251	50,580	384,913
1874	312,172	54,540	43,545	410,257
1875	273,019	34,644	39,651	347,314

Other Countries.—In addition to the districts just passed in review, C. is grown in numerous other countries. During the infancy of the trade our spinners received 75 per cent. of the C. consumed from the West Indies, and the remainder from the Levant; with the great expansion of the culture in America, the supplies from the West Indies gradually fell off, the planters finding it more profitable to occupy their labor and capital in the production of sugar and other growths. Early in the present century, the imports into Great Britain from the West Indies averaged 80,000 bales per annum; but by 1858 the arrivals had dwindled to 6500 bales, of which only about 2200 bales were from the West Indies, properly so called. Under the stimulus of the high prices which ruled during the C. famine, the supplies from miscellaneous sources—that is, from all countries except the United States, East Indies, Brazil, and Egypt—rose from 6500 bales in 1858, and 9800 in 1860, to 23,000 in 1863, and 131,000 in 1865. With the decline in prices, the import fell to 100,000 in 1868. There was an increase to 166,000 in 1872, owing to the high prices ruling in that year, but the increase was chiefly from Peru. Since that year, with a falling market, the import from 'other countries' has annually diminished, being only 89,000 bales in 1875, against 166,000 in 1872, the decrease, like the previous increase, being principally in Peruvian. Twenty years ago, Peruvian cotton was almost unknown in the Liverpool market; in 1864, the imports reached 27,000 bales; in 1872 they amounted to nearly 105,000 bales; but in 1875 they fell to 56,000 bales.

4. *Consumption.*—Our remarks under this head will be confined to Europe and the United States of America. An immense quantity of C. is consumed annually in India, China, and Africa, but there are no means of ascertaining even an approximation of the amounts so used. There are 11 spinning and weaving mills in Bombay, containing 404,000 spindles, and 4294 looms; and there are 8 mills in other towns of the presidency. 'These,' says an official Report (1873), 'are quite independent of the old native manufactories, and were started entirely in consequence of the inferiority of the piece-goods imported from Manchester.' This inferiority was occasioned by the excessive and deleterious method of sizing adopted during the C. famine, in order to meet the demand for low-priced goods, and is a matter which has lately occupied the serious attention of the Manchester Chamber of Commerce. Besides the mills in the Bombay presidency, factories have also been erected in the Bengal and Madras presidencies; and in the North-west and Central Provinces; a considerable native manufacture is also carried on in Burmah.

Great Britain.—The origin of the C. trade of the continent dates as far back as the 10th c., at about which period the staple was introduced into Spain by the Mohammedans. Since that time the manufacture has continued to expand, more or less, until it has arrived at its present gigantic proportions. Though we have early mention of C. goods in the annals of almost every country of Europe, still the progress of the trade was very slow until within the past one hundred years. Indeed, before the middle of the 18th c., C. goods, properly so called, were never produced—the fabrics manufactured being a mixture of either C. and linen, or C. and wool, C. yarn being used for weft only. It is from the dates of the patents of Wyatt (spinning by rollers, 1738), Arkwright (water-frame, 1769), Hargreaves (jenny, 1770), Cromptom (mule, 1779), and Cartwright (loom, 1785), that the rise of our modern manufacture must be dated. The stimulus given to the trade of our own country by these inventions was instantaneous, and when adopted on the continent, a few years after their utility had been sufficiently proved, similar effects followed there. The following figures will give the reader an idea of the rapid extension of the consumption of C. in Great Britain:

IMPORT OF COTTON WOOL INTO GREAT BRITAIN.

	American. lbs.	Total of all kinds. lbs.
1701	none	1 976,659
1751	none	2,976,610
1771, one year after Arkwright's loom and Hargreave's Jenny	none	4,764,589
1780, year after Crompton's mule,	none	6,766,613
1785	none	18,400,384
1791	189,316	31,447.605
1794, year after the invention of the saw-gin	487,600	19,040,929

	American. lbs.	Total of all kinds. lbs.
1808		43,379,278
1820	89,999,174	151,672,655
1840	487,856,504	592,488,010
1860	1,115,890,608	1,390,938,752

1875	816,223,920	1,458,598,470

The imports of cotton in 1880 were 1,628,664,576 lbs., valued at £42,772,088. The following table furnishes particulars of the imports, exports, and home consumption of C. in periods from 1801 to 1875:

SUPPLY AND CONSUMPTION OF RAW COTTON IN GREAT BRITAIN, IN THOUSANDS OF BALES, FROM 1801 TO 1875.

Avrage Periods of Ten Years.	Import. *United States.*	*Brazil.*	*Egypt.*	*West Indies, &c.*	*East Indies.*	*Total.*	*Export.*	*Home Consumption.*	*Total Deliveries.*
1801—10,	127	72	..	81	19	299	8	291	299
1811—20,	159	130	..	54	70	413	31	346	377

1831—40,	818	128	31	22	131	1130	97	1014	1111
1841—50,	1190	113	52	13	209	1577	176	1403	1579
1851—60,	1778	125	106	9	432	2450	362	2070	2432
1861—70,	907	332	227	80	1405	2951	804	2151	2955
1871—75,	1873	525	397	129	1138	3962	727	3183	3910

The bales vary considerably in weight. In 1875 the averages were as follow: American, 439 lbs.; Brazilian, 160 lbs.; Egyptian, 602 lbs.; Smyrna, 370 lbs.; West Indian, &c., 205 lbs.; Surat, 390 lbs.; Madras, 300 lbs.; and Bengal, 300 lbs. During the C. famine, a considerable quantity of C. was received from China in bales averaging 266 lbs. The comparative statement in the following table shows the relative importance of the various sources of supply—actual and proportional—in 1802, and on the average in 1828—1830, 1858—1860, and 1874—1875. The quantities are given in millions of pounds—32·1 equal 32,100,000 lbs.

	Weight in lbs.				Proportion.			
	1802	1828—1830	1858—1860	1874—1875	1802	1828—1830	1858—1860	1874—1875
America	32·1	173·3	970·3	837·9	53·2	72·7	79·7	56·3
Brazil	10·5	30·4	19·4	73·2	17·4	12·8	1·6	4·9
Egypt, &c.		5·5	40·1	170·2		2·3	3·3	11·4

East Indies and China	2·7	23·2	176·4	386·6	4·4	9·8	14·5	26·0
Total	60·3	238·2	1217·0	1489·1	100·0	100·0	100·0	100·0

The factory returns for 1875 state that there were in Great Britain, in that year, 41,300,000 spindles (including 3,800,000 doubling spindles), and 463,000 looms, and that 479,500 persons were employed in the manufacture. The various buildings and machines are said to have cost £66,000,000, and it has been calculated that a floating capital of £30,000,000 is employed in carrying on the trade. If we take into consideration the persons employed in the building of the mills and making of the machines, and in the buying and selling of raw and manufactured material, it will be found that something like 4,500,000 individuals are dependent upon the prosperity of the cotton trade for their livelihood. The total quantity of yarn exported in 1880 was 215 000,000 lbs., worth £12,000,000; and the total quantity of calicoes, cambrics, fustians, &c., was 4,495,000,000 yards, worth £57,677,000. Besides these, there were £6,000,000 worth of lace, small-wares, &c.; which raises the total value to £75,677,000.

France and Alsace.—The first import of C. into France took place in 1668—viz., 450,000 lbs. *viâ* Marseilles from the Levant. In 1750, the receipts reached 6,978,588 lbs.; but during the wars of the Revolution and the first Empire, little progress was made. In 1815, the import was 36,200,000 lbs.; in 1825, it rose to 55,150,000 lbs.; in 1836, to 118,000,000 lbs.; in 1846, to 159,000,000 lbs.; in 1856, to 211,000,000 lbs.; in 1860, to 270,000,000 lbs. In 1862, the arrivals fell to 127 millions, owing to the stoppage of supplies from America. In 1869, the consumption was estimated at 242 millions; but the war cut down the figures to 165 millions in 1870, and 185 millions in 1871. In 1874, there was a rise to 208 millions. These latter figures are exclusive of Alsace and Lorraine, which use about 65 million lbs.; making 273 millions for France, as she stood before the war, against 242 millions in 1869. The number of cotton spindles in France is about 5,200,000. In Alsace there are about 1,700,000.

Belgium.—The average import of C. into Belgium in 1836—1840, was about 39,500 bales; in 1846—1850, 56,600 bales; in 1856—1860, 61,000 bales; in 1870, 91,000 bales; and in 1874, 127,000 bales. In the last-named year, 91,000 bales were consumed; part of the remainder was forwarded to Germany, Switzerland, or Alsace, and part was added to stock. The number of spindles in Belgium is variously estimated at from 650,000 to 800,000.

Switzerland.—The trade of this confederation has flourished considerably. In 1833, its consumption was about 6,000,000 lbs.; in 1843, about 22,000.000 lbs.; in 1859, about 28,000,000 lbs.; in 1874, about 52,500,000 lbs. The first spinning-machine was set up at Zurich in 1807. In 1826, the number of spindles was 300,000; in 1830, 400,000; in 1835, 650,000; in 1840, 750,000; in 1845, 850,000; in 1850, 950,000; in 1860, 1,350,000; and at the present time, about 2,100,000. Prior to the Franco-Prussian war, the Swiss spinners received the bulk of their raw material *viâ* France, but now they are supplied mainly through Holland and Germany. The manufactured products of Switzerland are well liked, and compete successfully with those of England in the various continental markets.

Holland.—The C. trade of Holland is chiefly a transit one. The imports in 1872 reached 268,000 bales; in 1873, 180,000 bales; and in 1874, 168,000 bales. The deliveries were 224,000 in 1872, 180,000 in 1873, and 183,000 in 1874; but only about 28,000 bales per annum were retained for consumption, the remainder passing to Germany, &c. The number of spindles in Holland is about 230,000.

German Empire.—Under this head are included the various political divisions of Germany. The several states have made considerable progress in the production of C. fabrics. The C. is received chiefly through the ports of Hamburg and Bremen, but a considerable quantity is also received *viâ* Holland and Belgium, while a further portion is received in South Germany from Trieste. The average imports into Hamburg, Bremen, Amsterdam and Rotterdam, in the five years ended with 1840, reached 109,000 bales; in the five years ended with 1855, they averaged 233,000 bales; in the three years ended with 1874, they averaged 655,000 bales. The deliveries in the last-named period, however, did not exceed 644,000 bales—the balance being retained in stock. The number of spindles in Germany in 1846 was about 815,000; in 1858, 2,000,000; and in 1874, 3,500,000, besides 1,700,000 in Alsace; making a total of 5,200,000. The Germans consume nearly the whole of their own produce, and are besides large buyers of English yarns and goods. The leading seat of the manufacture after Alsace is Saxony; then follow Bavaria, Prussia, Baden, Würtemberg, &c.

Austria.—In the C. trade, Austria has made the least progress of any country on the continent. In 1854, there were in all Austria, including Lombardy and Venice, about 1,533,000 spindles; while in 1872 (including the Italian provinces for the purpose of comparison) there were only 1,900,000—an increase of only 24 per cent. in 18 years. The manufactures receive nearly the whole of their raw material *viâ* Trieste. The deliveries from that port averaged about 82,000 bales in the five years ended with 1840; 107,000 in 1851—1855; and 125,000 in the three years ended with 1874. The C. trade of Trieste has increased considerably since the opening of the Suez Canal, by which means the spinners of Austria and South Germany have been brought into direct communication with India. Formerly a large quantity of C. was annually exported from Liverpool to Trieste, but the success of M. Lesseps' enterprise has entirely destroyed this branch of trade.

Italy.—The statistical materials relating to this part of the continent are very scanty. The imports into Genoa and Naples in 1851 amounted to about 31,000 bales; in 1860, they reached 94,000, but a good portion of this was forwarded to Switzerland and other places. In 1870, the import was only 47,000 bales; in 1871, the

figures reached 92,000; in 1874, fell to 64,000. There are considerable imports also into Venice and Naples. The number of spindles in Italy is estimated to amount to about 700,000, capable of using 88,000 bales per annum.

Spain.—The C. trade of Spain is the oldest in Europe, but until recently has made the slowest progress of any. During the past twenty-five years, however, things have greatly improved. In 1850, the annual consumption was only about 80,000 bales; in 1860, it reached 106,000; and in 1870, 152,000; and in 1874, 189,000. There are in Spain about 1,500,000 spindles, capable of using about 189,000 bales of 370 lbs. each.

Russia.—The C. manufacture of this empire is of comparatively recent origin. The imports of raw C. in 1824—1826 (average of three years) were only 2,700,000 lbs.; in 1833—1835, they reached 6,200,000 lbs.; in 1845—1847, 28,000,000 lbs.; in 1853—1855, 55,000,000 lbs.; in 1858—1860, 94,000,000 lbs.; and in 1869—1870, 100,000,000 lbs., besides a considerable quantity from Bokhara, say from 15,000,000 to 20,000,000 lbs. This immense increase in the consumption of raw C. has considerably curtailed the demand for English yarn. In 1838, we exported 19,311,877 lbs. yarn to Russia, but in 1865, only 1,700,000 lbs.; and in 1872, about 3,000,000 lbs. The number of spindles in Russia is estimated at 2,100,000, capable of using 136,000,000 lbs. of cotton. Except in times of depressed trade, the mills work night and day, each mill having two sets of hands.

Sweden, &c.—There are in Sweden and Norway about 300,000 spindles. The coarser sorts of yarn are produced, and the annual consumption of C. is about 18,000,000 lbs., or 48,650 bales of 370 lbs. each. The C. is imported partly from Liverpool, and partly direct from the United States.

United States.—The first C.-mill built in the United States was in 1791; the second in 1795; the third in 1803; the fourth in 1804; followed by eleven more during the next three years. In 1810, there were 31,000 spindles; in 1831, 1,246,503 spindles; in 1850, 3,633,693; in 1860, 5,035,798; in 1868, 6,600,000; and in 1874, 9,415,000. In 1831, the consumption of C. amounted to 182,000 bales; in 1850, 613,000; in 1860, 843,000; in 1868, 968,000; in 1871, 1,173,000; and in 1874, 1,313,000. In 1851—1852 (average of two years), the consumption represented 21 per cent. of the C. grown, but in 1871—1875, 28¼ per cent.! Europe has therefore to look to other countries to supply her increased requirements, as we have already shown in a previous portion of this article.

Down to 1845, supply kept constantly ahead of demand, and, at the close of that year, the stock of C. in Europe reached 1,219,000 bales, or about 27 weeks' consumption, the average rate at that time being about 45,000 bales per week. The result was a very serious fall in prices—middling Orleans descending to 3⅞*d.* per pound. The produce of America had almost driven the growth of every other country out of the market, and in 1846, the imports from the United States represented 86 per cent. of the total arrivals! The great decline in values naturally led to a serious reduction in the rate of production, which reduction was further aggravated by unfavorable seasons in the South, and in 1846 the imports from the United States fell to 401 million pounds, and in 1847, to 364 millions, against 626 millions in 1845. Then followed a sharp reaction in prices, and ultimately an important recovery in the amount of supply. Between 1845 and 1856, however, consumption encroached upon production to such an extent, that the stock in Europe at the close of 1856 was only 439,000 bales, or about six weeks' consumption; against 1,219,000 bales, or 27 weeks' requirements, at the end of 1845. In the autumn of 1857, therefore, middling Orleans touched 9⅝*d.* per pound. Thence to 1860, there was a gradual recovery in stocks, and a corresponding decline in prices; but even at the end of 1860, the stock was only 782,000 bales, or about 9½ weeks' consumption, and though middling Orleans had, in the interval, declined to slightly below 6*d.*, the average price for the five years ended with 1861 was 7*d.* per pound. Then followed the American War, of the effects of which we have already written.

The following table furnishes particulars of the consumption of C. in Europe and the United States in average periods from 1826 down to 1874. (The total import of C. into the United Kingdom amounted, in 1880, to 14,541,648 cwts.)

In the healing art, C. and the cloth and wadding made from it are used for wrapping up and keeping warm, and of late much more than formerly for binding up burns and wounds. A prejudice formerly prevailed against the use of C., as irritating to wounds; but experience has shown this opinion to be unfounded and C. is now used in many hospitals quite as freely as linen.

Cotton Manufacture.—It has already been remarked that the modern system of C. manufacture dates no further back than about 1760. Prior to the mechanical inventions of Hargreaves, Arkwright, Crompton, and Cartwright, the arts of spinning and weaving were entirely domestic, and the instruments of manipula-

STATEMENT OF THE CONSUMPTION OF COTTON IN EUROPE AND THE UNITED STATES FROM 1826 TO 1874 (IN THOUSANDS OF BALES AND MILLIONS OF POUNDS.)

tion much the same as those which had been in use in the East for centuries before. By means of the ancient distaff and spindle, or the more recent spinning-wheel, only *one* thread at a time was produced, and the process, as may be imagined, was tedious, and not very remunerative; besides which, only a very inferior yarn was the result; for whilst a tolerable thread could be spun from flax, the produce of C. was soft, weak, and uneven, and in weaving was used for *weft* (or *transverse* yarn) only, with linen, woollen, or worsted for the *warp* (or *longitudinal* yarn). Altogether, in the middle of the 18th c., the machinery for spinning was much more imperfect than that for weaving, and the weavers of the time were often at a stand for want of yarn to go on with.

This state of things had long occupied the attention of the thinking portion of the spinners, but without any practical result until the invention of the 'jenny,' by Hargreaves, about 1767. By this machine, eight threads at a time could be spun against the one of the spinning-wheel. Hargreaves was much abused by the populace of his native town and neighborhood, who feared that the invention would deprive them of all employment; the machine was destroyed, and the inventor compelled to leave his birthplace. Genius, however, ultimately triumphed, and the 'spinning-jenny' was patented at Nottingham in 1770. The year previously, Arkwright had patented his 'water-frame,' or 'throstle,' for spinning by rollers, by means of which a stronger and much firmer yarn was produced. It was about this period that fabrics composed entirely of C. were woven for the first time, the 'jenny' supplying the *weft*, and the 'throstle' the *warp*. A few years later, Mr. Crompton brought out a new piece of mechanism, which he styled the 'mule-jenny,' from its combining the principles of both Hargreaves' and Arkwright's patents; but it had an advantage over both, insomuch as it produced a much finer yarn than either. The 'mule' came into full play in or about 1780, which is the period assigned for the birth of the *muslin* trade. There was now no longer a scarcity of yarn; the fear was, that there would be too much, for it was clear that the hand-loom weavers of the time could not keep up with the improved spinning machinery. But the invention of the 'power loom,' by Dr. Cartwright, in 1785, set aside all doubts in this respect; the question now was, whether a sufficient quantity of raw C. could be obtained in order to keep pace with the requirements of the rising manufacture. West India C., which in 1784 averaged 1*s.* 6*d.* per lb., rose to 2*s.* in 1788; 2*s.* 1*d.* in 1792; and 2*s.* 8*d.* in 1798. Great exertions were made to obtain increased supplies from India; but the invention of the saw-gin in America brought the required succor from an unexpected quarter. It was only by means of this machine that the production of the short-stapled C. of the United States could be made at all remunerative. The export of hand-cleaned C. in 1791 was only 189,316 lbs., and in 1792 only 138,328 lbs.; but the year after the appearance of the gin—viz., 1794—the exports rose to 1,601,700 lbs.; in 1795, to 6,276,300 lbs.; and in 1800 to 17,789,803 lbs.

But to return. The first 'mule-jenny' contained about *thirty* spindles, which, instead of being stationary, as in the 'jenny' and 'throstle,' were placed on a carriage, which was moved outwards, in order, whilst twisting, to increase the fineness of the thread, and inwards again, to wind the yarn on the spindles. This required the constant attendance of a spinner to wheel the carriage backwards and forwards; but subsequent improvements have gone so far as to produce what is called the self-acting mule, two or three of which only require the assistance of one person, generally a boy or girl, whose place it is to piece any of the threads which may break during spinning. Mules of this construction are made with as many as 1000 or 2000 spindles, sometimes more; and with the self-actor, as now improved, a single thread has been produced measuring upwards of *one thousand miles in length*, and yet weighing but *one pound!*

A word or two on the processes preliminary to spinning. The raw material is received from the various producing countries, packed either in bags or square bales. On arrival at the mill, the C. first enters the *mixing-room*, where it is *sorted*, and the various qualities, which are often contained in a single purchase, laid out in layers of equal extent, one over the other, and trodden close together. In this manner, two descriptions of C. are sometimes placed in one mixing. When Surat, for instance, is scarce and dear, and short-stapled low American plentiful and cheap, spinners of what are called coarse numbers invariably use a mixture of both growths; the same of other kinds, provided there is an approach to equality in length of fibre. C. of different shades of color are also sometimes spun together, in order to produce a particular yarn. A quantity of this *bing*, as it is called, is then raked down from the top to the bottom of the side, a portion of each layer being thus secured. This is carried to the *scutching* or *willowing machine*, by means of which the C. is cleansed from all impurities, such as sand, seeds, leaf, &c. The cleaned C. is then taken to the *spreading-machine*, through which it passes, and is then wound, in a fleecy state, upon a large wooden roller, to be transferred to the *carding-machine*. The latter machine is brought into requisition for the purpose of drawing out the fibres of the C. into parallel layers, so as to facilitate the twisting of them together. Originally, this process was performed by hand. The first improvement was made by Lewis Paul in 1748, and the next by Hargreaves in 1760. Arkwright and subsequent spinners have perfected the machine. The C. was formerly cleaned by hand. The *sliver* is next passed through the *drawing-frame*, which removes all inequalities, and reduces the bands to one uniform thickness. Here also several of the slivers are joined together (called *doubling*), so as to form one continuous cord, which is still further lengthened and increased in fineness by the *roving-machine*, whence it passes on to bobbins ready for *spinning*. Under the heads SPINNING and WEAVING, will be found a full description of the various processes above briefly glanced at. Other branches of the subject are treated of under CALICO-PRINTING; CALENDERING; DYEING, &c.

The finer kinds of yarn are spun from Sea Island and long-staple Egyptian, and from them are fabricated our muslins, laces, &c. From Brazil and the better classes of short-stapled American, come our cambrics, calicoes, shirtings, sheetings, &c., and from the inferior qualities of American and Surat are spun the coarse yarns required for fustians and other heavy fabrics. Yorkshire broadcloths are sometimes half cotton. From warps of C., and wefts of wool or worsted, are formed varieties of Orleans cloths, Coburgs, mousselines de laine, damasks, &c. There are also fabrics composed of silk and C., linen and C., alpaca and C., &c.

Of the total amount of yarn produced, from one-fifth to one-fourth is exported in its raw state. The following figures will give the reader an idea of the progress of our export trade in C yarns and goods:

	Yarns.			Manufactured Goods Exported.			
	Total Spun.	Total Exported.		Entered by the Yard.		At Value only.	Total Value of Yarn and Goods.
	lbs.	lbs.	£	Yards	£	£	£
1816	78,987,200	15,740,675	2,628,448	189,263,731	12,309,079	746,643	15,684,170
1830	622,840,000	63,678,116	4,133,741	441,578,498	14,119,770	1,175,153	19,428,664
1845	494,766,000	135,766,487	6,963,235	1,091,686,069	18,029,818	1,126,288	26,119,341
1860	965,993,000	197,343,655	9,870,875	2,776,218,427	40,346,342	1,795,763	52,012,380
1874	1,120,525,000	220,599,004	14,516,093	3,587,132,479	54,355,800	5,380,477	74,232,370

In 1818, 14,743,675 lbs. of twist were exported, of which 14,727,882 lbs. went to Europe, and only 1861 lbs. to India and China. In 1843, 149,206,448 lbs. were exported; 128,664,218 lbs. to Europe; 899,746 lbs. to America and Africa; and 12,642,484 lbs. to India and China. In 1874, of the 220,599,000 lbs. exported, 77,438,000 lbs. went to Germany and Holland, 62,781,000 lbs. to India, China and Japan. In 1880, there were in all 215,544,800 lbs. of yarn exported.

In 1820, Germany was the best customer for both our plain and printed cottons. The next largest consumer for *plain* cottons was Italy; then followed the Brazils, United States, Russia, Portugal, East Indies, Holland and Belgium, West Indies, &c.; and for *printed* cottons—British West Indies, United States, Italy, Holland and Belgium, Portugal, East Indies, Brazil, &c. The Netherlands were the principal buyers of our laces and small wares; then Germany, British West Indies, Central America, Brazils, United States, East Indies, Portugal, Russia, Italy, &c. At the present time the East Indies take nearly one-third of our exported manufactured goods. For *plain calicoes*, our next best customer is China; then follow Turkey, Brazil, Egypt, United States, Portugal, Italy, Germany, &c.; of *printed and dyed calicoes*, Turkey is the largest purchaser; then follow India, Brazil, Germany, United States, France, West Indies, Central America, &c. The United

States take nearly one-half our exports of *lace and patent-net;* then follow Belgium, France, Holland, Germany, &c. The United States take over one-third of our exports of *stockings*, and one-half of our shipments of other sorts of *hosiery;* then follow Australia, the Argentine Republic, &c. One-fourth of the *sewing-thread* exported goes to the United States; then follow Germany, Brazil, Russia, &c.

Subjoined is an estimate of the weight and value, of the total production of cotton manufactures in Great Britain, with the cost of cotton consumed, and the balance remaining for wages, all other expenses, interest of capital, and profit for the years 1870, 1872, and 1874 (000's omitted; 1,071,770 = 1,071,770,000):

	1870.	1872.	1874.
WEIGHT.	lbs.	lbs.	lbs.
Cotton consumed	1,071,770	1,175,345	1,266,129
Waste in spinning	129,310	134,965	145,604
Yarn produced	942,460	1,040,380	1,120,525
Exported in yarn	186,078	211,940	220,599
Do piece-goods, &c.	616,232	698,840	726,000
Consumption and stock	140,150	129,600	173,926
Total as above	942,460	1,040,380	1,120,525
VALUE.			
Yarn exported	£14,671	£16,710	£14,516
Goods, &c., do	61,424	69,900	66,934
Consumption and stock	17,050	15,660	20,110
Total	£93,145	£102,270	£100,560
Cost of cotton consumed	42,145	48,054	40,225
Left for wages, expenses, profits, &c.	£51,000	£54,216	£60,335

The figures relating to the export of 'piece-goods, &c.,' include two-thirds of the goods shipped as apparel, haberdashery, &c. The average annual production of yarn and goods for the three years 1870–72, was 1,018,563,000 lbs., distributed as follows:

	lbs.	Per cent.
Exported to India, China, Japan, &c., including 47,000,000 lbs. yarn	333,000,000	32·70
Exported to all other countries, including 150,166,000 lbs. yarn	529,030,000	51·94
Left for Home Consumption and Stock	156,533,000	15·36
Total as above	1,018,563,000	100·00

In round numbers, therefore, it may be said that one-third of the total production of cotton goods is exported to the East, one-half to other countries, and one-sixth consumed at home.

With the great improvements which have taken place in the mechanics of the trade, and the reduced price of the raw material, a gradual but considerable decline has taken place in the cost and price of the fabrics produced. The price of 1 lb. of yarn containing 100 hanks, in 1786, was 38*s.*; in 1807, 6*s.* 9*d.*; in 1829, 3*s.* 2*d.*; at the present time, 2*s.* 6*d.* The *cost* of weaving during the last sixty years has been reduced upwards of sixty per cent. A species of calico, selling at 6*s.* per yard towards the close of the last century, can be purchased in our day at as many pence! The average price per yard of *goods* exported in 1815 was 1*s.* 5½*d.*; in 1825, 10⅛*d.*; in 1835, 6½*d.*; in 1845, 3 15/16*d.*; and in 1859, 3 7/8*d.* In 1864, the price rose to 6*d.* per yard, but in 1874 it fell to 3⅝*d.* per yard. The average price per lb. of *yarn* exported in 1815 was 3*s.* 7⅝*d.*; in 1825, 1*s.* 11½*d.*; in 1835, 1*s.* 4⅝*d.*; in 1845, 1*s.* 0½*d.*; and in 1859, 11¼*d.* In 1864, the average rose 2*s.* 4¼*d.* per lb.; but in 1874, fell to 1*s.* 3¾*d.* per lb. The most profitable years for spinners are said to have been 1845, 1848, 1859, 1860, and 1871.

The earnings of the work-people have upon the whole steadily increased from year to year. The following table furnishes the rates current in 1839, 1849, 1859, and 1875. It will be observed that the proportionate advance during the last sixteen years was much greater in the lowest than in the highest paid hands:

AVERAGE WEEKLY WAGES.

	1839. Week of 69 Hours.	1849. Week of 69 Hours.	1859. Week of 60 hours.	1875. Week of 60 Hours.
	s. d.	*s. d.*	*s. d.*	*s. d.*

Other branches show the same ratio of advance.

The following table exhibits the extent of the manufacture at the close of 1874:

Estimated weight of *cotton* consumed	1,226,129,000 lbs.
" value of same, at 7⅞*d.* per lb	£40,226,000
" weight of *yarn* produced	1,120,525,000 lbs.
Declared weight of yarn exported	220,599,000 lbs.
" value of yarn exported (1*s.* 3¾*d.* per lb.)	£14,516,000
Number of yards of goods exported	3,587,132,000 yards.
Declared value of same (3⅝*d.* per yard)	£54,356,000
" " other cotton goods exported	£5,380,000
Total declared value of all cotton manufactures exported	£74,232,000
Total declared value of all British exports	£297,650,000
Proportion of *cotton* exports to *entire* exports per cent	25 per cent.
Estimated number of persons employed	479,000
" average rate of wages per week	13*s.*
" total amount of wages paid in twelve months	£15,190,000

ESTIMATED FIXED CAPITAL.

Cost of 41,300,000 spindles, at 25*s.* to 27*s.* per spindle, inclusive of buildings, &c.	£53,690,000	
Cost of 463,000 power-looms, at £26 each	12,038,000	
		£65,728,000

ESTIMATED FLOATING CAPITAL.

Employed in carrying on the routine of business	£18,000,000	
Cash at bankers	12,000,000	
		£30,000,000

The average price of cotton consumed in 1860 was 6⅝*d.* per lb.; in 1861, 7½*d.*; in 1864, 1*s.* 10½*d.*; in 1867, 10⅝*d.*; in 1871, 8½*d.*; and in 1881, 6 9/16*d.* The average prices of the principal descriptions in 1871 to 1875 were as follows:

	Uplands. Mid.	Pernam. Fair.	Egypt. Fair.	Dhollera. Fair.	Bengal. Fair.
1871	8 9/16*d.*	8½*d.*	8⅞*d.*	6⅝*d.*	5⅞*d.*
1872	10 9/16*d.*	10⅝*d.*	10½*d.*	7½*d.*	5½*d.*
1873	9*d.*	9⅜*d.*	9 1/16*d.*	6 5/16*d.*	4½*d.*
1874	8*d.*	8¼*d.*	8¼*d.*	5 5/16*d.*	4¼*d.*
1875	7⅜*d.*	7 15/16*d.*	8 7/16*d.*	5*d.*	4 5/16*d.*
1875, Dec. 31.	6⅜*d.*	7½*d.*	7⅝*d.*	4 1/16*d.*	4⅛*d.*

Except Bengal, prices at the end of September and December 1875 were lower than since 1860.

The Cotton Famine.—The American civil war broke out in 1861, and in 1862 our import of cotton fell to 524 million pounds, against 1257 millions in 1861, and 1391 millions in 1860. Increased supplies from India and other sources brought the arrivals up to 669 millions in 1863, 893 millions in 1864, 978 millions in 1865. The war closed in 1865, trade with America was resumed, and the imports in 1866 rose to 1377 million pounds, and the cotton industry shortly afterwards resumed its former dimensions. At the crisis of the famine the mills were not working more than half-time, and in December 1862, 247,000 cotton operatives and others connected with the trade, were out of employment, and 165,000 others only partially employed. In the same month, 234,000 persons, or 24 per cent. of the total population of the districts affected, were in receipt of charitable relief. In 1863, the average number of persons out of work was 189,000, and that of those only partially employed, 129,000; in 1864, the figures were 134,000 and 97,000 respectively; and those for the first five months of 1865, 107,000 and 68,000. During the course of the famine, the losses of the trade amounted to between £65,000,000 and £70,000,000, including from £28,000,000 to £30,000,000 loss of wages to operatives. Of the latter amount about one-fourth was recovered in the form of relief, or in wages for employment in public works, &c. The total sum distributed

in charity alone was about £3,000,000. In some districts in 1863, the poor-rate rose to nearly 6*s.* in the £. In the same year, the average rate for the whole of the cotton districts was 2*s.* 2¾*d.*, against only 7¾*d.* in 1861. See also COTTON FAMINE.

COTTON, GUN. See GUN COTTON.

COTTON, SIR ROBERT BRUCE, a distinguished English antiquary, founder of the Cottonian Library, now in the British Museum, was born at Denton, Huntingdonshire, 22d January 1570. He was educated at Cambridge, and soon after taking his degree of B.A. in his 16th year, he commenced those archæological pursuits which have made his name famous, and proved of such immense value to British historians. The dissolution of the monasteries about half a century before, dispersed many valuable collections of manuscripts into private hands, and C. hunted up and purchased these wherever practicable. On account of his eminent abilities and great knowledge, he was frequently consulted by ministers of state on difficult constitutional points and international questions. In 1600 at the request of Queen Elizabeth, who desired to have the views of the Society of Antiquaries on the matter, he wrote *A Brief Abstract of the Question of Precedency between England and Spain.* King James, by whom he was made a knight, employed him to vindicate the conduct of his mother, Mary Queen of Scots, and also to examine whether the Roman Catholics, on account of whom some alarm was then felt in the nation, should be imprisoned or put to death. C. took the most humane view of the matter. His intimacy with the earl of Somerset led him to be suspected of complicity in the death of Sir Thomas Overbury, and in consequence he was imprisoned for about five months. In 1629, a tract entitled *A Project how a Prince may make himself an Absolute Tyrant*, was obtained from his library, the tendency of which was considered dangerous to the liberty of the state. His library was accordingly declared unfit for public inspection, and he himself was denied all use of it. His heart being bound up in his library, he pined and died in less than two years after, on 6th of May 1631.

The COTTONIAN LIBRARY, which now forms so important a part of the British Museum, was, after the death of Sir Robert C.'s son and grandson, who augmented it considerably, invested in trustees for the use of the public. In 1730, the library was removed to Ashburnham House, Westminster, where the royal collection was; and in the following year a fire occurred in the house, in which about 114 out of the 958 MS. volumes of which the library consisted were reported as 'lost, burned, or entirely spoiled; and 98 damaged so as to be defective.' Fortunately, however, under the care and intelligence of skilful keepers, a great number of these injured volumes have been restored, so that the library now consists of nearly 900 volumes, of which, says Mr. Edwards in his *Memoirs of Libraries*, 'nearly 200 are state papers of the highest value. They include a vast series relating to the diplomatic intercourse between England and almost every state of Europe, extending from the reign of Edward III. to that of James I.; and of these documents, no small proportion consists of the original letters of sovereigns and of statesmen. Even those papers which are not original have a high degree of authority, as being, for the most part, coeval transcripts.' The Cottonian Library was transferred to the British Museum (q. v.) in 1757. In addition to the MSS., the Cottonian collection consists of many valuable coins and antiquities.

COTTON FAMINE. The history of manufacturing industry does not present a more striking episode that that which was connected with the effects of the Civil War in America on the cotton manufactures of Great Britain in 1861 and following years.

The years 1859 and 1860, unparalleled for the magnitude of the cotton manufacture, had much to do with the collapse that followed. So rapidly has this branch of industry increased in Lancashire, that the immigrants into that county from other districts have varied from 10,000 to 20,000 a year for a long series of years, irrespective of the natural increase of population by the excess of births over deaths. The imports of raw cotton, the exports of manufactured cotton, the number of mills, the number of hands, all were at their maximum in 1860. The imports were 1390 million lbs., of which 1054 millions were worked up in Great Britain. There were 1920 mills in Lancashire, 275 in the adjacent portions of Cheshire and Derbyshire, and enough elsewhere to make up a total of 2650. There were 440,000 hands employed in these mills; by age, 90 per cent. adults and young persons, and 10 per cent. children; by sex, 44 per cent. males, and 56 females. The machinery was worked by steam-engines having an aggregate of 300,000 horse-power. There were more than 30,000,000 spindles making from 4000 to 6000 revolutions per minute; and 350,000 power-looms. The fixed capital in mills and machinery was valued at £54,000,000; while the money paid for wages in that year was £11,500,000. The cotton goods of various kinds manufactured for home consumption used up 180 million lbs. for cotton, and were valued at £24,000,000; while the exported goods—consisting of 2776 million yards of calico, muslins, &c., and 197 million lbs. of yarn—were valued at the enormous sum of £50,000,000; besides £2,000,000 more for cotton hosiery and small wares. The total value for home consumption and export, £76,000.000, exceeded the total imperial revenue for that year. Considering that, of 1390 million lbs. imported, no less a weight than 1120 millions came from the United States, there is at once evidence afforded of the tremendous effect that would be produced by any stoppage in the American cotton-trade. Irrespective of this, however, there would have been a stagnation in our manufacturing districts in 1861, even if raw cotton had been plentiful and cheap. The manufacturers had glutted all the markets by the wholly unprecedented extent of their operations in 1860. The English warehouses, as well as those elsewhere, were full; and time was needed to carry off the immense stock. There were cotton goods on hand in Great Britain at the end of the year valued at £20,000,000; while in India our merchants continued to pour in goods even when the consignments of 1860 exceeded £17,000,000.

Fort Sumter was bombarded in April 1861. This was virtually the beginning of the American Civil War, and the beginning also of the rise in the price of cotton. A blockade was early established by the Federal government of Washington; and it was only by 'running' this blockade that cotton-laden ships could clear from the Southern or Confederate ports. The price of Middling Orleans (the kind of cotton mostly used, and that which governs the price of all other kinds) rose from 7¾*d.* to 9*d.*, 10*d.*, and 12*d.*, as the year advanced. There was thus a twofold motive for lessening the operations of the Lancashire mills—the markets were so fully supplied with manufactured goods, that no immediate augmentation was necessary; while the increase in the price of the raw material rendered manufacturing less profitable than before. The Liverpool dealers made colossal fortunes by the enormous rise in price of every bale of cotton which could reach the country from any quarter; while the manufacturers were also prosperous, because they could sell their accumulated stocks of calicos and yarns at much higher prices than had been obtainable in 1860. It was the operatives who suffered. One by one, the mills were put upon half-time, because the mill-owners had not much inducement to spin and weave, under the extraordinary double influence above adverted to. It was not until autumn, however, that these effects were heavily felt, when there was the enormous quantity of 1000 million lbs. of cotton, raw and manufactured, on hand in Great Britain. When half-time began at the mills in October, there were, in Lancashire and the two neighboring counties, 890 spinning-mills, 593 weaving-mills, 635 spinning and weaving mills, and 152 other cotton-mills of miscellaneous kinds, employing 369,453 factory-hands; and all these four classes of establishments became equally embarrassed. India or Surat cotton could still be had in considerable quantity, at 10*d.* per lb. instead of its former price of 5*d.*; but it was greatly out of favor, on account of its dirty condition, and the shortness and hardness of its staple. In November, there were 49 mills stopped, throwing out 8063 hands, while 119 were working half-time—placing something like 20,000 persons on half their usual wages. In December, Middling Orleans rose to 12*d.* So singular was the state of things, and so unlike what would be called a 'famine,' under other circumstances, that the actual quantity of raw cotton in Great Britain at the end of the year (280 million lbs) was greater than ever before known in the history of the trade; but as the market-price of yarns and piece-goods at that time scarcely equalled that of raw cotton *plus* wages, the manufacturer could scarcely operate without a loss; and therefore, he either closed his mill, or placed his hands on half-time. It was not so much a famine of cotton as a famine of employment.

The year 1862 opened very gloomily. Relief committees began to be formed in Manchester, Wigan, Blackburn, Preston, and other towns, to distribute subscribed funds to such of the hands as were totally out of work. The streets were thronged with the unemployed; but there was no disturbance, and scarcely any begging. Sewing-schools were established by ladies in the several districts, to teach the factory girls useful domestic needle-work—of which they are generally very ignorant—to get them to make clothes for themselves and others; and to shield them from the vicious temptations which would beset them during a period of idleness. The ladies also won upon the affection of the girls by reading to them, and sympathizing in many ways with their sorrows. Many of the manufacturers set apart large rooms as school-rooms and soup-kitchens for the boys and men, and abundant stores of soup were provided at 1*d.* per basin. The Poor-law Board sent down instructions to the local guardians how to give as much elasticity as possible to the system of parochial relief. In April, Blackburn had only 18 mills on full-time out of 84, the rest being either on half-time or closed; and there were 9000 of the inhabitants receiving parochial relief. Most of the other towns were in nearly as bad a plight. In May, matters were worse; Preston had 10,000 operatives out of work, and Blackburn had just about half-employment for 27,000. Middling Orleans rose in price to 15*d.*, and manufacturers had more inducement to specu-

late in cotton than to spin it. Meanwhile, great efforts were made to assist the distressed operatives. The letters of a 'Lancashire Lad' in the *Times*, with the text, 'Con yo help us a bit?' made a great impression. The *Daily Telegraph* raised a fund of £5000 by its own exertions. The Lancashire landowners established a 'Cotton District Relief Fund' in London, to which they subscribed £11,000 in one day; the Lord Mayor established a 'Mansion-house Committee,' which received subscriptions from all parts of the world; Manchester established a 'Central Relief Committee,' as a nucleus for various local funds; while a great county meeting brought in £130,000, of which £70,000 was subscribed in one day in one room. Mr. Farnall was sent down by the Poor-law Board, as special commissioner, to superintend the plans for parochial relief. A Rate-in-aid Bill was passed through parliament, to enable the government to issue Orders in Council, authorizing parishes to raise money on the guarantee of future rates; it was only to be done where the current poor-rate had already reached a high figure, and the money raised was to be applied strictly to mitigate the distress of the operatives. Notwithstanding all these sources of assistance, the work-people became reduced to great distress. 'The pawnbrokers' stores,' said an eye-witness, 'were glutted with the heir-looms of many an honest family. Little hoards were drained to meet the exigencies of the time. Many found it the sorest trial of their lives to ask for food; and it is a happy circumstance for all to remember, as it is honorable to those of whom it is recorded, that none suffered more severely than those who had a struggle to overcome their unwillingness to subsist upon food which they had not earned.

Rents were falling in arrears, and many a house which had held only one family, was now occupied by three or four, in order to economize rent, fuel, and furniture.' Nevertheless, none died of privation, and the average sickness was even less than usual. It was a fact well ascertained that spirit-drinking was less indulged in than in times of full wages. Meanwhile, the manufacturers began to make great profits; the prices of yarn and calicos rose rapidly, and the stocks were sold off which had been so long on hand. Middling Orleans rose to 2*s*. 3*d*. in October, and thus there was less inducement than ever to purchase for the sake of manufacturing. Strange as it may appear, 50,000 bales of cotton were resold by the manufacturers themselves during the year, at the very time when the phrase 'cotton famine' was on the lips of every one; but the simple fact was, that more profit could be made by reselling than by manufacturing.

It was a gloomy winter, that of 1862—1863, for the mill-hands. In October, the loss of wages was estimated at £136,000 per week. In November, there were 208,000 persons in a Lancashire district receiving out-door parochial relief, and 144,000 others aided by subscribed funds; there were at the same time 20,000 mill-girls at the sewing schools. At Christmas, there were 250,000 hands totally out of work; those, and about as many more dependent on them, received £40,000 a week from the parishes and the committees. Vast sums were sent from various parts of the world to be spent in winter-clothing only, and prodigious stores of second-hand clothing were contributed by private families. As the money relief seldom exceeded 2*s*. or 2*s*. 6*d*. per week per applicant, to purchase clothing out of this was of course impracticable. The small shopkeepers also suffered greatly; for there was only one-third the amount of wages received by their customers per week that had been received two years before. Emigration schemes were much discussed, but were not carried on very largely, because Lancashire men felt convinced that trade would revive after a time. Meanwhile, the *rate* of wages was not lowered; few mill-owners proposed it, and the operatives were rootedly against it; however small the quantity of work, it was paid for at the old rate.

No date can be named for the actual cessation of the distress; it died out by degrees. When the manufacturers had sold off their old stocks, they recommenced buying more to spin and weave; because, although the price of raw cotton was enormously high (2*s*. 5*d*. for Middling Orleans in May 1863), the selling price for calicos and muslins was now proportionately high, and therefore they could manufacture at a profit.

In June 1863, a 'Public Works Act' was passed, to enable the government to advance £1,200,000 for public works in the cotton districts—partly to make good drainage, roads, water-supply, &c., and partly to yield £600,000 or £700,000 as wages to the unemployed cotton-hands in doing so much of the work as they could manage. The money (to be repaid by parish rates at subsequent dates) was to be advanced by the Exchequer Loan Commissioners on the recommendation of the Poor-law Board, and a government engineer was to examine and sanction the several works to be executed. All these operations were to be confined strictly to the cotton districts, where the distress existed. Mr. R. A. Arnold, the resident government inspector of these public works, states in his *History of the Cotton Famine*, that by the month of June 1865, there had been works planned, and in great part executed, under the clauses of this and a supplementary bill, to the amount of £1,846,000. They comprised the making or improving of 276 miles of street and highway, 304 miles of main sewer, reservoirs for 1500 million gallons of water, several parks and cemeteries, and a large area of land-drainage. Nearly 30,000 persons had been fed by the wages of the cotton operatives on these works. The subscriptions to meet the distress reached the vast sum of £2,000,000; while the out-door poor relief was about £1,000,000 more than in an equal period of average times.

The fluctuations in the value and quantity of cotton available during this extraordinary period are strikingly shown in the following parallel columns, relating to the raw cotton imported, and the money paid for it:

	Quantities (Cwts.).	Value.
1860	12.410.000	£35,757,000
1861	11,223,000	38,653,000
1862	4,678,000	31,093,000
1863	5,978.000	56,278,000
1864	7,976,000	78.204.000
1865	8.732.000	66,032,000
1866	12,296,000	77,521,000

COTTON GRASS (*Eriophorum*), a genus of plants of the natural order *Cyperaceæ*, having the fruit accompanied with long silky hairs which spring from the base of the ovary. The species are not very numerous; they are natives of the colder regions of the northern hemisphere. Several are found in Britain, and their white cottony fruit-bearing spikes are well-known in our moors and bogs. The cottony substance has been used for stuffing pillows, making candle-wicks, &c. Mr. Helliwell has shown that a firm and beautiful cloth can be made of it; and according to him, it might be gathered in some places, without cultivation, at a cost of twopence or threepence per pound. The stems of a Himalayan species, *E. cannabinum*, called *Bhabhur*, yield a very strong fibre, and are much employed for making cordage, being simply twisted into cables, of which rope-bridges are usually made; but they are not durable, and require much repairing every year.—C. G. is said to be valuable for sheep-pasture. Its leaves were formerly employed as a remedy for diarrhœa, and the spongy pith of the stem to expel tape-worms.

Cotton Grass (*Eriophorum*).

CO'TTONWOOD. See POPLAR.

CO'TTUS, a genus of acanthopterygious fishes, of the *Mailed Cheek* family or *Sclerogenidæ*, having a large depressed head, more or less armed with spines or tubercles, a tapering body destitute of scales, and two dorsal fins. Some of the species are marine, others inhabit fresh water. Of the latter, the Bull-head (q. v.) is an example. The marine species are mostly found in northern seas. A few occur on the shores of Britain, of which the most common are the Sea Scorpion (*C. scorpius*) and the Father Lasher (*C. bubalis*), both of which are very often left by the receding tide in rock-pools, and amongst sea-weeds. The greatest size to which they attain on the British coasts is only about 10 inches, but in more northerly seas, they become much larger. They form a principal part of the food of the Greenlanders. Notwithstanding their large gill-openings, they live long out of water.

COTU'RNIX. See QUAIL.

COTYLE'DON (Gr., a cup or cup-shaped hollow) or SEED-LOBE, in Botany, a principal part of the embryo in phanerogamous or flowering plants. Cryptogamous plants are *Acotyledonous* (q. v.); their seeds or *spores* have no cotyledons. Phanerogamous plants are divided according to their seeds into *Monocotyledonous* (q. v.), having only one C., and *Dicotyledonous* (q. v.), having two cotyledons. With the latter are ranked some *Coniferæ* remarkable for having more than two cotyledons, which form a sort of whorl. The cotyledons enclose the *plumule* or *gemmule;* and in germination they usually come above ground as the first leaves (seed-leaves) of the young plant—the plumule in dicotyledonous plants, appearing between them—and they become at the same time more leaf-like; but in some plants, which have thick fleshy cotyledons, they remain underground. In either case, they contain a store of nourishment, by which the young plant is sustained on its first germination. Instances of cotyledons remaining under ground may be seen in the common pea and bean; and instances of cotyledons coming above ground, in the kidney-bean and scarlet-runner, plants of the same natural order. Cotyledons are sometimes very thick, sometimes very thin and delicate; those of the same seed are generally equal, but not always so; they are fre-

quently undivided, but sometimes cut and lobed. The cotyledons of dicotyledonous plants are often simply applied face to face; when if the radicle is folded along their edges, they are said to be *accumbent;* if it is folded on their back, they are *incumbent*. Sometimes the two cotyledons of a seed are *conduplicate*, or laterally folded; sometimes they are *reclinate*, or folded from apex to base; sometimes *convolute*, or laterally rolled up; sometimes *circinate*, or spirally rolled up with the apex innermost. These terms are of importance in descriptive botany, as characters of high value are often furnished by the seed.

Couchant.

COU'CHANT. In Heraldry, a beast lying down, with his head up, is couchant. If the head is down, he is DORMANT.

COUCH GRASS (*Triticum repens*), also called *Wheat Grass, Dog Grass, Quickens*, and *Squitch*, or *Quitch*, a grass which, although of the same genus with wheat, is chiefly known to British farmers as a troublesome weed. It is common in most parts of Europe and North America. It grows to a height of 1½—3 feet, and has two-rowed spikes and flat spiklets, the side of which is applied to the rachis. It is perennial, and its creeping roots render it extremely difficult of extirpation; they are carefully gathered out of land under cultivation, but they make the plant very useful in fixing loose sandy soils, so as to form pasture. It is not, however, esteemed a very nutritious grass. The roots are sweet and mucilaginous, and are collected at Naples for feeding horses; they have also been dried and ground into meal, to make bread in times of scarcity. A kind of beer is made from them, and in some countries they are much used in domestic medicine. They are diaphoretic and aperient.—The popular name *Squitch*, or *Quitch*, is also given to some other perennial grasses.

Couch Grass.

COUCHING. See CATARACT.

COUCY, RENAUD, CASTELLAN OF, a court-poet belonging to the north of France, who flourished probably in the latter part of the 12th century. The love-songs ascribed to him are distinguished above all similar productions of the same epoch by the great warmth of passion displayed. They are addressed, of course, to a mistress, whose name, in accordance with the fashion of the time, is not mentioned. From their contents, we can gather little or nothing of the circumstances of C.'s life, except that he had become a crusader, and had separated himself very reluctantly from the object of his adoration. It is supposed that he accompanied Philippe Auguste and Richard Cœur de Lion to the Holy Land, probably in the service of Raoul Sieur de Coucy, with whom, indeed, he is often confounded. Like Tristan and Isolde, C. and his mistress soon became patterns of true but unfortunate lovers. As early as the first half of the 13th c. the *Roman d'Aventure* gives a very prolix and incredible account of both. The best edition of the *Chansons du Châtelain de C.* was edited by Franç. Michel (Paris, 1830).

COU'GAR. See PUMA.

COUGHING, considered physiologically, consists, 1st, in a long inspiration which fills the lungs to a greater extent than usual; 2d, in the closure of the glottis, or narrow opening in the organ of voice (see LARYNX), at the commencement of the act of expiration; and, 3d, in the sudden forcing open of the glottis by the violence of the expiratory movement. In this way, a blast of air is driven upwards from the lungs through the mouth, which carries with it any sources of irritation that may have been present in the air-passages. C. may occur from irritation in the back of the throat, in the larynx, trachea, or bronchial tubes, and may be excited by acrid vapors, by irritant gases, or by articles of food or drink—such as even a drop of water or a crumb of bread—making their way into the air-passages instead of into the pharynx, or by excessive or morbid secretion from the walls of the air-tubes, or even by the entrance of cold air, when the lining membrane of the air-passages is abnormally irritable.

It is not very easy to explain to the non-professional reader *how* cough is produced. From the medulla oblongata, or uppermost part of the spinal cord (lying within the cavity of the cranium), there is given off a very important nerve called, from its distribution to the lungs and stomach, the pneumo-gastric nerve (q. v.), which contains both sensory and motor filaments. The sensory filaments are distributed to the mucous lining of the larynx, trachea, &c. Any of the irritating substances already mentioned may produce an impression upon these sensory filaments which, being conveyed to the medulla oblongata, gives rise, through the motor filaments, to the transmission of motor impulses to the various muscles which are concerned in the act of coughing. Other motor nerves, especially those supplying the intercostal muscles and the diaphragm, co-operate powerfully with the motor filaments of the pneumo-gastric.

The object of C. in the animal economy is unquestionably to guard against the danger of the entrance of mechanical and chemical irritants into the air-passages; and accordingly the mucous membrane, especially of their upper part, is endowed with a most exquisite sensibility which, when aroused by irritation or by a state of disease, provokes incessant coughing until the irritation be allayed or removed. Cough is an exceedingly common symptom of all diseases of the respiration. See PNEUMONIA, CONSUMPTION, BRONCHITIS, CATARRH, &c.

Cough occurs amongst the lower animals under similar conditions. From continued breathing of a close foul atmosphere, the bronchial mucous membrane becomes unduly irritable, hence the prevalence of chronic cough amongst the cows in our overcrowded town-dairies. Chronic cough also occurs in horses, usually as a sequel to repeated attacks of bronchits. It constitutes unsoundness, is best treated by repeated doses of belladonna and camphor, but often requires for its entire removal a run at grass.

COULOMB, CHARLES AUGUSTIN DE, known by his experiments on friction, and his invention of an instrument—the *Torsion Balance* (q.v.)—to measure the force of magnetic and electrical attraction, was born at Angoulême in 1736, and in early life entered the engineers. In 1777, he gained a prize by an essay on the construction of magnetic needles (*Sur les Aiguilles Aimantées*). In 1779, his *Théorie des Machines simples* gained the prize offered by the Academy; and in 1781, he was a third time successful in an essay on the friction and resistance of cordage, &c., used in machines. In the same year he was elected as member of the Academy, and his services were employed on all the most difficult problems in mechanics. Having offended certain influential persons by reporting unfavorably on their project of a navigable canal in Bretagne, C. was for some time imprisoned, but received from the States of Bretagne a present of a seconds' watch, as a reward of his firm opposition to an expensive and unprofitable scheme. C. lived in retirement during the Revolution; became a member of the Institute, 1804; and died August 23, 1806.

COU'LTER. See PLOUGH.

COU'MARIN, or TO'NKA STEARO'PTEN (see STEAROPTEN), is a camphor-like substance of a very agreeable smell, which gives their fragrance to the well-known Tonka Bean (q. v.), (*Dipterix odorata*), so much used for flavoring snuff; the Woodruff (*Asperula odorata*); the Melilot (*Melilotus officinalis*); a number of grasses, as the sweet-scented Vernal Grass (*Anthoxanthum odoratum*); and the Faam or Faham leaves (*Angræcum fragrans*), much prized among the Asiatics for their vanilla-like scent; and is probably the cause of similar fragrance in many other plants. C. may be procured from Tonka beans by digestion in ether. It crystallizes in small prisms, is colorless, has the smell of the bean, and is scarcely soluble in cold water, but dissolves pretty easily in boiling water. A beverage well known in Germany as *May Drink*, and made of wine and woodruff, derives its flavor from coumarin.

COU'NCIL, or SY'NOD, is an assembly of ecclesiastical dignitaries held for the purpose of regulating the doctrine or discipline of the church. As early as the 2d c., church councils were convened in which only one or two provinces took part, the bishops and presbyters binding themselves to carry out the decisions arrived at in their own communities. These assemblies were commonly held in the chief town or metropolis of the province, and the bishops of such capitals—who, after the 3d c., bore the title of *metropolitan*—were wont to preside over the meetings, and to consider questions of doctrine and discipline which had arisen within the territory.

Over these metropolitan councils were established, at a later period, the provincial synods, exercising authority over several united provinces, and finally, the national councils. After the 4th c., when the Christian religion was established in the Roman empire, we read of *œcumenical*, i. e., universal councils, so called because all the bishops of Christendom were invited or summoned by the emperor. In some early synods, we find bishops, presbyters, and others, taking part in the deliberations; but after the opening of the 4th c., only the bishops were convened. According to the doctrine of the Roman Catholic Church, the pope alone, or, by way of exception, in some cases the college of cardinals had the power of convening œcumenical councils, which, in the Catholic view, represent the universal church under the guidance of the Holy Ghost. Questions were determined by the majority of votes, and the pope or his proxy presided and confirmed the resolutions carried in the synod. In matters of faith, the Holy Scriptures and the traditions of the church are the guide; while in lighter matters, human reason and expediency were consulted. In the former, œcumenical councils are held to be infallible, but in other matters of discipline, &c., the latest synod decides questions. The question of the pope's subordination to the decrees of

the œcumenical councils was long and warmly debated, but the recent Vatican council may be said to have set the question at rest. Twenty œcumenical councils are recognized in the Roman Catholic Church—9 eastern and 11 western.

1. The synod of apostles in Jerusalem, wherein the relation of the Christian doctrine to the Mosaic law was determined. (See Acts, c. xv.). 2. The first C. of Nice, held 325 A.D., to assert the Catholic doctrine respecting the Son of God in opposition to the opinions of Arius. 3. The first C. of Constantinople, convoked under the Emperor Theodosius the Great (381 A.D.), to determine the Catholic doctrine regarding the Holy Ghost. 4. The first C. of Ephesus, convened under Theodosius the Younger (431 A.D.), to condemn the Nestorian heresy. 5. The C. of Chalcedon, under the Emperor Marcian (451 A D.), which asserted the doctrine of the union of the divine with the human nature in Christ, and condemned the heresies of Eutyches and the Monophysites. 6. The second C. of Constantinople, under Justinian (553 A.D.), which condemned the doctrines of Origen, Arius, Macedonius, and others. 7. The third C. of Constantinople, convoked under the Emperor Constantine V., Pogonatus (681 A.D.), for the condemnation of the Monothelite heresy. 8. The second C. of Nice, held in the reign of the Empress Irene and her son Constantine (787 A.D.), to establish the worship of images. 9. The fourth C. of Constantinople, under Basilius and Adrian (869 A.D.), the principal business of which was the peace of the eastern and western churches, and the deposition of Photius, who had intruded himself into the see of Constantinople, and the restoration of Ignatius, who had been unjustly expelled. 10. The first Lateran C., held in Rome under the Emperor Henry V., and convoked by the pope, Calixtus II. (1123 A.D), to settle the dispute on investiture (q. v.) 11. The second Lateran C., under the Emperor Conrad III. and Pope Innocent II. (1139 A.D.) condemned the errors of Arnold of Brescia and others. 12. The third Lateran C., convened by Pope Alexander III. (1179 A. D.), in the reign of Frederick I. of Germany, condemned the 'errors and impieties' of the Waldenses and Albigenses. 13. The fourth Lateran C., held under Innocent III. (1215 A.D.), among other matters asserted and confirmed the dogma of transubstantiation and necessity for the reformation of abuses and the extirpation of heresy. 14. The first œcumenical synod of Lyon, held during the pontificate of Innocent IV. (1245 A.D.), had for its object the promotion of the Crusades, the restoration of ecclesiastical discipline, &c. 15. The second œcumenical synod of Lyon, was held during the pontificate of Gregory X. (1274 A.D.). Its principal object was the re-union of the Greek and Latin churches. 16. The Synod of Vienne in Gaul, under Clemens V. (1311 A.D.), was convoked to suppress the Knights Templars, &c. 17. The C. of Constance was convoked at the request of the Emperor Sigismand, 1414 A.D., and sat for 4 years. It asserted the authority of an œcumenical C. over the pope, and condemned the doctrines of John Huss and Jerome of Prague. 18. The C. of Basel was convoked by Pope Martin V., 1430 A.D. It sat for nearly 10 years, and purposed to introduce a reformation in the discipline, and even the constitution of the Roman Catholic Church. All acts passed in this C., after it had been formally dissolved by the pope, are regarded by the Roman Catholic Church as null and void. 19. The celebrated C. of Trent, held 1545—1563 A.D. It was opened by Paul III., and brought to a close under the pontificate of Paul IV. The Vatican C. above mentioned, held in 1870, decreed the infallibility of the pope. For details of the more important councils, see NICE, BASEL, CONSTANCE, TRENT, &c.

Among the provincial or local synods convened after the division of the church into east and west, we may mention that of Clermont (1096 A.D.), when the first crusade was proposed, and that of Pisa (1409 A.D.), when three popes were contending for the see of Rome. Among Protestants no general C. has ever been convened; but several particular synods have decided various questions. Of these synods one of the more remarkable was that of Dort in 1618, when Calvin's creed was asserted against the Arminians.

The decrees of the Roman Catholic councils were edited by Mansi (31 vols., 1759—1798). See Hefele's *Conciliengeschichte* (7 vols., 1855—1874).

COUNCIL, PRIVY. See PRIVY COUNCIL.

COUNCIL, TOWN. See TOWN COUNCIL.

COUNCIL OF WAR is a conference of officers, in military or naval warfare, on some matter in which the commander wishes to fortify his judgment by an appeal to that of others. The French make a special provision for a Council of Defence in a garrison. The governor or commandant may summon the heads of departments to meet him in consultation whenever he may think such a step desirable; and the opinions expressed at such meetings are placed upon record. The commandant of a garrison generally solicits the opinion of a C. of W. before surrendering to besiegers. The English military code leaves these matters to the discretion of the commander. In the navy, a C. of W. consists usually of flag-officers only; but officers of lower rank occasionally assist.

COU'NSEL. See ADVOCATE and BARRISTER.

COUNT (Fr. *comte;* Lat. *comes*). In classical writers, down to the end of the 4th c., the meanings attached to the word *comes* were comparatively few and simple. At first it signified merely an attendant, and differed from *socius* chiefly in expressing a less intimate and equal relation to the person accompanied. Suetonius uses it for an attendant on a magistrate. A little later, in Horace's time, it was applied to those young men of family whom it had become customary to send out as pupils under the eye of a governor of a province, or the commander of an army. Very soon the fashion of having similar attendants at home was introduced, and Horace speaks of this necessity as one of the miseries of a high position. The emperor, of course, had many *comites* in this sense; and to these, as he gradually became the center of power, he transferred the various offices of his household, and even of the state.

. Around his person these comites formed a sort of council of state, very much resembling that instituted by the first Napoleon. The example of the emperors of the west was followed by the emperors of the east, though at Byzantium the title attached less to the office than to the individual. Most of the titles of our own court officials are translations of those belonging to similar officers in the lower empire. The *comes sacrarum largitionum* was the grand almoner; the *comes curiæ*, the grand-master of ceremonies; the *comes vestiarius*, the grand-master of the wardrobe; *comes equorum regiorum*, the grand equerry, &c. The *comes marcarum*, or count of the marches, there can be little doubt, was the original of the *marquis* of later times. In France, the C. of the palace (*comes palatii nostri*) was the highest dignitary in the state after the *maire* of the palace; and in the 11th c. he had already acquired a rank apart from that of the other counts. He presided in the court of the sovereign in his absence, and possessed sovereign jurisdiction. The habit of instituting counts-palatine was adopted by Spain and England. Those counts, again, who, at a later period, as rulers of provinces, assumed something approaching to sovereign power, arrogated to themselves the right of appointing counts-palatine under them—e. g., the Counts of Chartres, of Champagne, of Blois, Toulouse, &c.; and the ancient houses of Chartres and of Blois continued to claim in perpetuity the title of C.-palatine as that of their eldest sons. Counts of this sovereign class owed their origin to the feebleness of the later Carlovingian kings, under whom they contrived gradually to convert the provinces and towns which they had governed as royal officers into principalities hereditary in their families. It was then that the counts came to be known by the names of their counties. Since the great revolution, the title of C. in France has been purely honorary, and has been used with a license which has almost deprived it even of that character. The title was never used in England, though its Latin equivalent has always been the common translation for Earl (q. v.), and the wife of an earl, from a very early period, has been styled *countess*. For the history of the office in Germany, where it was of great importance, see GRAF.

COUNT AND RE'CKONING, the technical name given in the law of Scotland to a form of process, by which one party compels another to account judicially, and to pay the balance which may be found to be due. In these actions a remit is usually made to an accountant.

COU'NTER APPROA'CH, in Military Engineering, is a trench or passage, cut by the defenders of a fortified post from some of the outworks towards the besiegers, and leading to a battery in a small work. Its object is to enable the defenders to foil the approaches of the besiegers, by carrying the fight further away from the body of the place, and enabling the besieged to enfilade the besiegers' batteries and approaches.

COU'NTER-CHANGED, or CO'NTER-CHANGED, in Heraldry. When several metals and colors are intermixed, one being set against the other, they are said to be counter-changed.

COUNTERFEIT. See COINING.

COUNTERFORT, in Fortification, is a mass of stone or brickwork added to the revetment of a rampart, in such a way as to form a buttress for resisting the pressure of the mass of earth. Counterforts occur at intervals of about 20 feet, and assist in preventing the earth from pushing down the revetment-wall into the ditch.

COUNTER-GUARD, is an outwork designed to defend the two faces of a bastion or ravelin from a direct fire, so as to retard a breach being made. The C. consists of two lines of rampart parallel to the faces of the bastion or ravelin, and separated from them by a narrow ditch. The crest of the C. must be some three feet lower than that of the works it covers, in order not to obstruct the defence. Lest the enemy should establish a battery on the

C., the terre-plein, or flat space behind its parapet is made very narrow.

COUNTER-IRRITANTS, agents applied to the skin so as to redden (rubefacients), to vesicate (blisters or vesicatories), or to produce postules, purulent issues, or even sloughs of skin and of the subcutaneous textures. The milder C. are mustard (see CATAPLASM), turpentine applied on warm cloths, and spirit or acetic acid in lotion. The stronger are blisters of cantharides (q. v.) or of ammonia; croton-oil (q. v.) or tartar emetic (q. v.), in ointment; setons, caustic or pea-issues, and the moxa; and above all, the actual cautery (q. v.) or hot iron. None of the stronger C. should be used without careful consideration and medical advice; great mischief is often done by their careless or improper use. C. relieve internal pain, and tend to promote the absorption of morbid effusions.

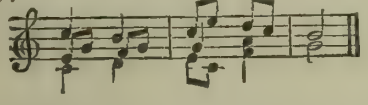
Amongst horses, C. are much used for strains and diseases of the joints, but should never be applied, as they too often are, in recent cases, or whilst the part is hot or inflamed. Cantharidine preparations, of ointment of biniodide of mercury, are the most convenient. For cows, use hot fomentations, followed by the smart infriction of mustard-paste; for dogs, soap-liniment, strengthened, if required, by ammonia or turpentine.

COUNTERMARCHING. See MARCHING.

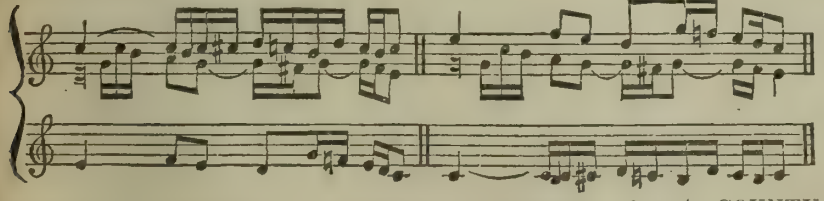
COU'NTERMINE, in Military Engineering, is a gallery or chamber, excavated under the glacis or some other part of a defence-work of a fortress. Its purpose is to foil a besieger. In a fortress on a large scale, there are envelope galleries, counterscarp galleries, listening galleries, galleries of communication, and other subterranean passages, under various parts of the outworks, all for the purpose of assisting the defenders in discovering and frustrating plans laid by the besiegers. Listening galleries are sometimes pushed forward even to the foot of the glacis. In such places, selected men put their ear to the ground, and listen for the approach of the enemy, as denoted by the sound of tools used in driving a mine or gallery of attack. The sound of a pickaxe so employed can be heard through the ground at a distance of 60 feet. As there are no openings above, these galleries cannot be driven beyond a certain distance, as the sappers would be stifled for want of air. If a mine be driven to blow up the defence-works, a C. is driven to blow up the besiegers; and sometimes the two parties carry their works so far as to meet in the subterranean passages, and there fight. If there be only a thin wall of earth left between them, they will fire pistols through bored holes, or drive in cartridges or smoke-balls. This terrible work is mostly carried on by sappers and miners.

COUNTER-PASSANT, in Heraldry, when two beasts are passing each other the contrary way.

COU'NTERPOINT, in Music, means the setting of a harmony of one or more parts to a melody. In the early age of the science, notation was represented by mere points on the lines. The setting of parts to a melody already represented by a row of dots or points was therefore called *punctum contrapunctum*. In this respect C. is nothing else but the uniting of various harmonious parts. In a more circumscribed sense, it is the art or manner of accompanying a given melody with other parts. Simple C. is a musical combination where the melody of the parts is not mixed or changed, and may be either all in notes of the same length or of different lengths, as for example:



If the parts be constructed in regard to one another so that they can be changed, or transposed over or under each other, without alteration in the movement, or injury to the harmony, it is then called double C., for example:



As double C. consists of the changing or transposing of one part over or under another, it follows that there must be as many different kinds of it as there are different intervals in the scale. We have, therefore, double C. of the octave as above, of the twelfth, tenth, ninth, &c. That of the octave is, however, the most useful, as it is more free in movement, and easier to recognize.

The first indication of contrapuntal writing is to be found in the 12th c. by Adam de la Hale, who received a genuine artistic education in the Netherlands, but was far in advance of his time, for his style of music was forbidden to be performed in the church by a bull of the pope, who gave Palestrina an order to replace it with a more simple music. The best masters for C. have been Kirnberger and Albrechtsberger in former times, and in modern times, Schneider, Hauptmann, and Dehn.

COUNTER-PROOF. An impression which is obtained from a freshly-printed proof of an engraving, by laying it, before the ink is dry, upon plain paper, and passing it through the press. By this means the ink is transferred from the wet proof to the plain paper, and a reversed impression is obtained, which is often of use in enabling the engraver to judge of the success of his work.

COUNTERSCARP, in Fortification, is the vertical or nearly vertical side of the ditch nearest to the besiegers, and opposite to the scarp or escarp.

COUNTERSIGN, in military discipline or manœuvres, is a word extended between sentinels, inspectors of posts going their rounds, or persons having business with the soldiers in camp or garrison. The C. in use at any particular time, is supposed to be known only to those immediately concerned, and is generally a simple word.

COUNTERSIGN, the signature of a secretary, minister, or other subordinate, to any writing signed by the principal or superior, as a guarantee for its authenticity.

COUNTER-TENOR, the highest adult male voice, and the lowest female voice.

COUNTER-VAIR, a heraldic fur. It differs from *Vair* by having its cups or bells of the same tinctures placed base against base, and point against point. The tinctures are OR and AZURE.

COU'NTERVALLA'TION, in Military Engineering, is a chain of posts constructed by the besiegers of a fortified place; it completely surrounds the place at a certain distance, and is intended to prevent sorties of the besieged. The posts are generally small redoubts, either isolated or connected by a line of earthworks. It is only during very protracted sieges that countervallations are constructed. They bear a certain relation to Circumvallation (q. v.).

COUNTIES CORPORATE. In England there are certain cities and towns, some having territory annexed to them, some scarcely any, which possess the privilege of being governed by their own sheriffs and other magistrates altogether independently of the counties in which they are situated. The Act 3 Geo. I. c. 5, for regulating the office of sheriff, enumerates twelve cities and five towns in this position. The cities are London, Chester, Bristol, Coventry, Canterbury, Exeter, Gloucester, Lichfield, Lincoln, Norwich, Worcester, and York. The towns are Kingston-upon-Hull, Nottingham, Newcastle-upon-Tyne, Poole, Southampton. From forming no part of the counties with which they were locally connected, they had no share in the county elections. To this extent twelve of the number are now included in their respective counties (2 Will. IV. c. 45, s. 17, schedule G).

COU'NTRY DANCE (Fr. *contre-danse*, of which the English term is a corruption), a dance in which as many couples can take part as there is space to accommodate them; at the commencement, the gentlemen being ranged on one side, and the ladies on the other. In its figure, the dancers are constantly changing places, leading one another back and forward, up and down, parting and uniting again. The numerous different figures, which give an interest to this dance, are generally designated with a particular name. The music is sometimes in $\frac{2}{4}$ time, and sometimes in $\frac{6}{8}$ time, and the step is more smooth than springing. The C. D. keeps its ground in England notwithstanding the introduction of many fashionable new dances. See DANCING.

COU'NTY, a term equivalent with shire. Although of the same signification, the terms are appliedon no uniform principle. In England and Scotland, the shires are also called counties; but in Ireland the term C. seems to be exclusively employed. Such, likewise, appears to be the case in the British colonies and United States. See SHIRE.

COUNTY COURTS. According to Blackstone, the *Sciremote* or ancient county court was established by Alfred the Great about 870; the suitors themselves being the judges. Henry II. appointed justices of assize courts, 1176, and thus the C. C. became superseded for judicial purposes. There is still a remnant of jurisdiction left in these ancient courts, unconnected, however, with the recovery of debts; outlawries of absconding offenders are here proclaimed, and certain proceedings connected with the election of coroners, knights of the shire, &c., take place in the old county court.

The modern C. C. were established in all the cities and large towns of England and Wales by C. C. Act, 1846, chiefly by the efforts of Lord Brougham; and the courts commenced business in March 1847. By the original Act the jurisdiction was not to exceed £20. In 1850 this was extended to £50 in all personal actions, and by a succession of Acts since that time the jurisdiction has been extended in many collateral points. In 1865 an equity jurisdiction was conferred on the C. C. to £500, and the judges have all the power and authority of the Court of Chancery in equitable suits. By the C. C. Act of 1867, actions of ejectment and actions of disputed title may be tried in C. C. where the value of the lands, &c. does not exceed £20. The jurisdiction of the C. C. is protected by the disallowance of costs in High Court, if less than £20 is recovered on contract, or £10 in tort. Causes commenced in the High Court may be remitted to the C. C. for trial. Any action of tort of whatever nature and amount may be remitted to the C. C. if plaintiff has no visible means of paying costs.

The C. C. are courts of record. In England and Wales there are 499 courts, divided into 55 circuits, presided over by 56 judges. The judges are appointed by the Lord Chancellor, or, where the whole district is in the duchy of Lancaster, by the chancellor of that duchy. Their salaries, owing to extended jurisdiction, are now nearly all £1500, and have, with slight variations, been made uniform throughout the country. Judges resigning from permanent disability are allowed a retiring pension not exceeding two-thirds of their annual salary. Each court has a registrar. The registrars are appointed by the judge, but the Lord Chancellor, or chancellor of the duchy of Lancaster, may remove them for misconduct. Their salaries depend on the number of *plaints* entered in their districts. In courts under 6000 plaints, they vary from £120 to £500, out of which the registrar provides a staff of clerks. Where the plaints exceed 6000, the salary is £650 and clerks; where they exceed 8000, £700 and clerks. Each court has also a high-bailiff, whose duties are outside, serving process and levying executions. In the smallest courts, their salaries may fall to about £140; in the largest, they may rise to £800 net. In 1866 an Act was passed for the abolition of the offices of treasurer and high-bailiff, as vacancies occur.

The registrar has power under C. C. Act, 1867, to take all undefended and admitted cases by leave of the judge. In every action or suit of whatever nature where more than £5 is claimed, and in all other actions, by leave of judge, a jury may be demanded at three clear days' notice. The number of jurymen to try a cause in C. C. is five. There were only 993 causes tried by a jury in 1878, out of 616,490 causes tried. The plaintiff obtained a verdict in 599,883 cases, and the defendants obtained verdicts or non-suits in 16,607 cases. There is a right of appeal in all cases where more than £20 is claimed, and by leave of judge in all other cases. There were only 87 appeals in 1878. By the Debtors Act, 1869, the judge only may commit to prison in cases where he is satisfied the debtor has the *means* to pay the debt or instalment thereof. There is no other ground of imprisonment for debt in C. C. In 1878 there were 5664 persons imprisoned out of 28,574 orders issued, the majority paying before imprisonment. A debtor may be committed for any period not exceeding forty-two days, and can be imprisoned only once for the same default.

Counsel and solicitors are frequently employed in the C. C., but as a rule suitors conduct their own cases. By the Bankruptcy Act, 1869, the C. C. in large towns (exclusive of London C. C.) have an unlimited jurisdiction in bankruptcy. They have also a limited jurisdiction in Admiralty, but this is exercised only by certain designated C. C. in maritime towns. The metropolitan C. C. have a jurisdiction *inter se*. Judgment once obtained can be followed out in any part of England and Wales.

The C. C. exercise jurisdiction under thirty-four Acts of Parliament. The gross charge of the C. C. in 1881–82 was £462,930.

COUNTY RATE, a local tax levied in England and Wales, for the purpose of defraying the expenses to which counties are liable; such as the maintenance of bridges, jails, lunatic asylums, prosecutions and costs incident thereto, coroners, &c. It is levied on all property liable to be assessed for the relief of the poor. Rogue-money in Scotland, and the grand jury cess in Ireland, are the taxes most nearly resembling the English county rate. See the Poor-law Commissioners' *Report on the Local Taxes of the United Kingdom*, 1846.

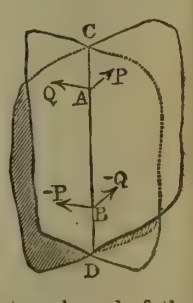
COUP is a French word signifying 'stroke.' It is used in certain phrases that have become current in Europe. *Coup d'état*, 'stroke of state,' means an arbitrary encroachment suddenly effected by the governing authorities upon the constitution of the state, altering or setting aside the prerogatives of other parts of the body politic.—*Coup de main*, 'a stroke of the hand,' is applied, in the language of war, to a sudden and successful attack.—*Coup d'œil*, 'a stroke or glance of the eye,' is applied in speaking of persons who have the faculty of comprehending all the relations of a complicated matter at one survey; or, in art, it expresses the general effect of a picture or group at first sight.—*Coup de théâtre*, means properly a trick of the stage to produce an effect by surprise, and is hence applied to any analogous proceeding.

COUPED (Fr. *coupé*), in Heraldry, is used to describe the head, or any limb of an animal cut off from the trunk, and smooth. It is distinguished from *erased*, i. e., forcibly torn off, and therefore ragged and uneven. A distinction is also made between *couped* and *couped close*, the latter signifying that the head or limb is cut off close, leaving no part of the neck or trunk attached to it. When crosses, bars, bends, and the like, are cut so as not to touch the sides of the escutcheon, they are also said to be couped.

COU'PLES, the name given in statics to pairs of equal parallel forces acting in opposite directions, and at different points of a body. It is shown in the art. Parallel Forces (q. v.), that when two parallel forces act in opposite directions on a body, they may be replaced by one equal to their difference acting parallel to them in the direction of the greatest, at a point *not* between but *beyond* the points where they are applied; and which point recedes the further from their points of application the nearer they approach equality, getting to an infinite distance when they become equal and when their resultant accordingly is zero. In this limiting case, the forces constitute a couple; they have no tendency to *translate* the body; their action goes wholly to make it rotate about an axis passing through its center of gravity, and perpendicular to the plane in which the couple acts. Such being the case, a couple cannot be replaced or counteracted by any single force, for such a force would produce translation; it can only be replaced or balanced by other couples. The length of the straight line which meets the lines of action of the forces at right angles is called the 'arm' of a couple, and the product of the force into its arm is called its 'moment.'

Most of the leading propositions in the theory of C. are readily seen to be true, as soon as they are stated. For instance, as the axis round which a couple tends to make a body rotate passes through the body's center of gravity perpendicularly to the plane of the couple, it does not matter what position the couple occupies in its own plane. Also, supposing the body to be rigid, the couple may be moved into any plane parallel to its own, provided its new position be rigidly connected with the original position. It is also obvious, on the principle of the lever, that the efficiency of the couple depends on its moment simply, so that its arm may be shortened or lengthened at pleasure, provided the force be increased or diminished as the case may require, so as always to make the product of the force and arm the same. Suppose ropes fastened at the bow and stern of a ship pulling with equal force in opposite directions; they will make the ship turn round an axis through its center of gravity, at a rate depending on the force applied to the ropes.

If the ropes be fastened to opposite points of the vessel nearer midships, it will only turn round at the *same* rate, provided the force applied to the ropes be *increased;* and, on experiment, it would be found that the force must be increased so as that its product into the distance between the ropes shall equal the product of the force in the first case into the length of the ship. Through this we can compound C. acting in the same plane, for we can turn them round till their arms coincide, and then give them a common arm; their forces will then act in the same lines, when their resultant into the arm will be the new couple. So two C. which are situated in planes inclined at any angle to each other may be replaced by a single couple (see fig.). Suppose the C. both to be moved in their respective planes till their arms coincide with the line of intersection of the planes, CD. Bring them then to a common arm in this line, AB. At each end of this arm we shall have a pair of forces, say P and Q, inclined to one another at the angle of inclination of the planes. Their resultant, by the composition of forces, will be a force R, acting in a line between the planes. We shall have then forces R acting at each end of the arm, and evidently in directions parallel and opposite. R × arm, AB, then, is moment of the resultant couple. Having seen how to compound C. whose planes are inclined to one another, the theory of the composition of C. may be said to be complete, for if they are in parallel planes, we know we can bring them into the same plane and to a common arm, and so into a common couple. In statical theory, any number of forces acting on a body, and not in equilibrium, may be reduced to a single force, a single couple, or a single force and a single couple. We have shown that the C. may all be reduced to one, as well as those forces which do not produce couples. If the single force do not act perpendicularly to the plane of the couple, it can always be compounded with the forces of the couple, so as to reduce the whole to a single force; if it act perpendicularly, then it cannot be com-



pounded with the couple, and the body will have at once a motion of translation and motion of rotation.

COU'PLET. Any two lines which rhyme together may be called a C.; but the term is more frequently used by critics to denote two lines which contain the complete expression of an idea, and are, therefore, to a certain extent independent of what goes before or what follows. The poetic wits of the age of Queen Anne excelled in this kind of aphoristic versification. Pope, it has been said, reasons in couplets. For example:

> 'Tis with our judgments as our watches, none
> Go just alike, yet each believes his own.'

COUPLING, an organ register, by which two or more rows of keys can be connected by a mechanism, so that they can be played together.

COUPON (Fr. *couper*, to cut), a term signifying any billet, cheque, or other slip of paper cut off from its counterpart. It is, however, applied chiefly to a dividend or interest warrant, which is presented for payment by holders of debentures. Coupons in Great Britain must now be stamped.

COURA'NT, in Heraldry, always used for *running*, which is its meaning in French.

COURBEVOIE, a town of France in the department of Seine, situated on the left bank of the river of that name, about 5 miles north-west of Paris. C. has well-built houses, mostly supplied with gardens, and large barracks erected by Louis XV. Its principal manufactures are white-lead and brandy, and it has some commerce by the Seine. Pop. (1876) 11,811.

COU'RGNÉ, a market-town of Piedmont, situated at the foot of a hill on the west side of the Orca, 12 miles west-south-west of Ivrea. It has several convents, and a population of 5600.

COURIER, Paul Louis, a French scholar and political writer, was born in Paris, January 4, 1772. He was educated for the army, but, without neglecting his military studies, he showed a special predilection for ancient literature. In 1793 he became lieutenant of artillery, served in the Italian campaign 1798—1799, and in 1803 was appointed *chef-d'escadron*. After the battle of Wagram, he tendered his resignation, which was accepted. He now proceeded to Switzerland and Italy, returning to his native country in 1812. Up to this period, he was known publicly only by his translations from the classics. In 1816 he appeared for the first time as a political pamphleteer, and rapidly obtained a brilliant reputation. The piece in which he made his *début* was the *Petition aux Deux Chambres*. In 1819—1820, he published in a journal, called *Le Censeur*, a series of letters containing an exposition of his political ideas, which were those of an ardent constitutional reformer. These letters, for keenness, wit, and eloquence, have been compared to those of Pascal. His *Simple Discours* (1821) was directed against the project then entertained of purchasing Chambord for the Duc de Bordeaux in the name of the nation. It is exceedingly vigorous, clever, and sensible, and had a great success. For his audacity, he was tried and condemned to one month's imprisonment. In 1823 he published his *Livret*, a kind of memorandum-book; and in 1824 his *Pamphlet des Pamphlets*, which is finely called by Armand Carrel *Le Chant du Cygne* (the Swan's Death-song). On the 10th April 1825 he was assassinated near his own house at Veretz, in the department of Indre-et-Loire, a little before sunset. The murderer was never detected. C. was the pamphleteer of the middle class. Manly earnestness, pleasant wit, cutting irony, and admirable sense are his characteristics. Time, which generally dims the lustre of a pamphleteer's reputation, has not touched that of C., which is still as bright as ever.

COU'RIERS. There are two distinct classes of couriers. The first to be noticed are employed by government to carry, securely and expeditiously, important dispatches to and from ambassadors at foreign courts. Active, and accustomed to travel, speaking several languages, and with a sufficient idea of their own consequence, they will set out at a moment's notice, pursue their way by steamer, by rail, by hired voiture, or on horseback, with little intermission by night and by day, until they reach their destination. Acquainted with routes, officials, and methods of clearing the way, and provided with all proper credentials, including a requisite supply of cash, nothing interrupts them in their eager course. Such are *Government C.*, a useful class of public servants. The other class of C. are not dissimilar in accomplishments, but their services are limited to private parties, and coming more generally into notice, we may enter more minutely into a description of their character.

Private Couriers.—These are usually persons of middle age, natives of Switzerland, France, or Germany, who have either been at some time gentlemen's servants, or been long employed as attendants on families while traveling on the continent. In some instances, they are of English origin, and have travelled again and again through Europe with employers who relish the dignity of having a man-servant, and dislike personal responsibility and trouble. Of whatever country the courier has settled down into a perfectly cosmopolitan character. With equal fluency, he speaks English, French, Italian, and German, with perhaps Spanish, Portuguese, and Russian; he is acquainted with processes of getting passports and visés; knows the best routes, the best hotels, and where anything curious is to be seen. Acting for the time as a servant, he is not intrusive. Whether by railway or steamboat he knows his place, and makes his appearance only when he is wanted. No doubt, the courier is an expensive luxury; his usual wages being from £8 to £10 a month, independently of traveling-fares. His keep at inns is nominally paid by himself, but, of course, it weighs with the hotel keeper in making out the bill. 'A courier, however, though an expensive luxury, is one which conduces much to the ease and pleasure of traveling, and few who can afford one will forego the advantage of his services. He relieves his master from much fatigue of body and perplexity of mind, in unraveling the difficulties of long bills and foreign moneys, sparing his temper the trials it is likely to endure from disputes with innkeepers, postmasters, and the like.

'If clever and experienced, and disposed to consult the comfort of his employer, he is a most useful person. His duties consist in preceding the carriage at each stage, to secure relays of post-horses; he must make arrangements for his employer's reception at inns where he intends to pass the night; must secure comfortable rooms, clean and well-aired beds, and order meals to be prepared, fires to be lighted, taking care that his master is called and the post-horses ordered at the right hour. He ought to have a thorough knowledge of everything that relates to a carriage; he should examine it at the end of each day's journey, to ascertain whether it requires any repairs, which should be executed before setting out. He should superintend the packing and unpacking of the luggage, &c. It falls to the courier to pay innkeepers and post-boys; and he ought to take care that his master is not overcharged. Besides this, he performs all the services of waiting and attendance, cleaning and brushing clothes; and he is not perfectly accomplished unless he has a smattering of the art of cookery' (Murray's *Hand-book for Travelers on the Continent*). As among ordinary domestics, there are honest and dishonest C., and it is of importance that travelers should not hire them without proper recommendations as to character. For places at which C. are to be heard of, we refer to the work just quoted, also to Bradshaw's *Continental Railway Guide*. In Paris, information respecting them will be obtained at Meurice's Hotel.

COU'RLAND, or KURLAND, a Russian government, and one of what are called the Baltic provinces, in lat. 56°—58° N., long. 21°—27° E. It was formerly an independent duchy—properly, indeed, consisting of two duchies, Courland and Semgall—and belonged, along with Livonia, to the Teutonic Knights. The difficulty of resisting the Russians led to the acknowledgment, in 1651, of the feudal sovereignty of Poland; and the last grand-master, Gotthard Kettler, secured the duchies of Courland and Semgall for his family. The country was long distracted by the contentions of two parties, one Russian and the other Polish; and after being for some time very completely under Russian influence, and the scene of many Russian intrigues, it was finally united to Russia in 1795. It contains about 10,500 square miles, with a population in 1880, of 682,000, mostly Protestants. It is generally a level country, with ranges of low hills, and contains many lakes, bogs, forests, and downs, but some parts have a very fertile soil. The proprietors of land are mostly German; the peasantry, of Lettish or Esthonian extraction, are chiefly engaged in husbandry; there is little manufacturing industry or commerce. The capital is Mitau; but the most flourishing town is Libau.

COURSE, in Building, is a continuous range of stones or bricks of uniform thickness.

COURSES, on shipboard, is a name given collectively to all the lower sails; above them is the group of top-sails, and highest of all, the group of top-gallant sails. The C. comprise the mainsail, foresail, main-staysail, fore-staysail, and mizen-staysail.

COURSING, a method of hunting hares by greyhounds, in which the dogs follow the game by *sight*, instead of by *scent*. C. is of very ancient date, having been practised by the Greeks. Within the last twenty years, however, its popularity as a sport has greatly increased, and the breed of the greyhound is now studied with nearly the same care and zest as that of the race-horse. The method pursued in C. is briefly as follows:

Meetings are held in open districts, well frequented by hares, where the greyhounds—technically called 'dogs,' as foxhounds are technically called 'hounds'—are entered by their owners for a variety of stakes, which are to be competed for—C., in this respect, partaking of the nature of a race between horses. The first thing done is to select a judge to decide upon the merits of the best dogs; second, a 'slipper' is appointed to hold the dogs in leash, and start them at the hare; and, third, a flag-steward is chosen, who remains near the judge and announces the color of the victorious dog by means of a red or white flag, according as

the competitors are arranged. The next thing done is to 'beat' the field for a hare. When one is found, the judge usually allows it 80 or 100 yards 'law' before he cries to the 'slipper' to let the dogs 'go.' Upon the word 'go,' the 'slipper' liberates the animals by a spring attached to the 'slips'—i. e., the long strong cord held by the 'slipper' and communicating with the leathern collars fixed round the necks of the dogs. The judge's duties now begin in earnest. He follows the dogs wherever they go, calculating carefully the number of 'points' made by each—a 'point' being any meritorious achievement on the part of the dogs (as when the one outstrips the other at any time, or turns the hare, i. e., causes it to 'double'); and at last he adjudges the victory, not *necessarily* to the dog which has killed the hare, but to the one which has made the most points during the course, i. e., which has exhibited the finest qualities of speed, sagacity, endurance, &c.

COURT (Fr. *cour*, Ital. *corte*, from Lat. *cohors*, or *chors*, *chortis*, an enclosure or cattle-yard; allied to Polish *grod*, a city; Sw. *gard;* Eng. *yard* and *garden*) was originally applied to the square or space enclosed by the buildings of a feudal castle; and hence it came to denote the persons immediately surrounding a feudal chief or superior. Its application is now confined to the residence and surroundings of sovereign princes. In England, and in other free countries, when we speak of 'the court,' we mean little more than the family and attendants of the sovereign, viewed not in a private, but a public capacity.

The bishops and nobles, the ministers of the Queen for the time being, and other persons entitled to precedence, either on hereditary, official, or personal grounds, are those who habitually encircle the sovereign; and 'the court circle' consequently means those persons of distinction, and their families, who are in the habit of approaching the Queen, and of associating with the other members of the royal family. But this circle is one the circumference of which is marked by no absolute line, like that which in France, under the old monarchy, divided the C. from the city.

COURT, PRESENTATION AT. The honor of being presented at C., or introduced to the sovereign, is only to be obtained by persons of respectable position, and is a thing sought after not only for the *éclat* of the ceremonial, but as giving a certain stamp of character; for, having been received by the sovereign, a person may with justice expect to be received anywhere. Valuable so far as a credential, a reception at C. is carefully guarded from abuse. At the C. of her Majesty, Queen Victoria, there is a scrupulous and very proper exclusion of all parties, male or female, of damaged reputation. Those who aim at the distinction of being presented at C. belong chiefly to what are called the higher circles—nobility and landed gentry; officers in the army, navy, and higher departments of the civil service; judges, magistrates, church-dignitaries, members of the learned professions; and the wives and daughters of these respective classes. Men of scientific, literary or artistic attainments do not generally attempt to appear at C., and neither, of course, do the classes engaged in trade. It is usual to be presented on taking office, or on attaining some personal dignity, or on arriving from an important and distant expediton. Young ladies of good family are said 'to come out,' on being presented at court. What perhaps contributes more than anything else to secure selectness, is the obligation of appearing in 'court-dress,' an expensive and somewhat fantastic costume of old date; from which only those who assume professional uniforms are exempted. As is well known, the court-dresses of ladies are superb. It will thus be seen that the notions prevailing among foreigners arriving in England—those from the United States in particular—as to the practicability of indiscriminate presentation at C., are erroneous. It is the duty of the Lord Chamberlain at St. James's to furnish information regarding the steps to be adopted by those who desire to be presented at C., either at levées, which are restricted to gentlemen, or at draw ing-rooms, which are chiefly, though not exclusively, intended for ladies.

The days on which these receptions take place are advertised in the newspapers some days before with the necessary directions for preventing confusion. Her Majesty's birthday is the occasion on which the greatest reception of the year takes place, but there are no new presentations on that day. Any British subject who has been presented at C. in England, can claim to be presented by the British ambassador at any foreign court. Those who wish to be mere spectators, can obtain tickets to the corridor, where they see the company passing in and out, by applying to the Lord Chamberlain. For this purpose, however, an introduction is required. It is indispensable that the names of gentlemen desiring to be presented, and of the nobleman or gentleman who is to present them, be sent to the Lord Chamberlain's office several days previously, in order that they may be submitted for the Queen's approbation. Gentlemen are also requested to bring with them two large cards, with their names clearly written upon them, one of which is left with the Queen's page in the presence-chamber, and the other is delivered to the Lord Chamberlain, who announces the name to her Majesty. The same rules apply to ladies. Lists of presentations appear next day in the principal London newspapers.

COURT BARON. See COMMON LAW, COURTS OF.

COURT OF COMMON PLEAS. See COMMON LAW, COURTS OF.

COURT OF SE'SSION, the highest civil tribunal in Scotland, was instituted in the reign of King James V., by statute dating 17th May 1532. The object of its institution was to discharge the judicial functions which originally belonged to the king and council, and which, since 1425, had in a great measure devolved on a committee of parliament, as the great council of the nation. The C. of S. consisted at first of 14 ordinary judges and a president. One half of these judges and the president were churchmen, and the practice of appointing ecclesiastics to the bench did not cease for some time even after the Reformation. The king had the privilege of appointing, in addition to the ordinary judges, three or four peers or members of his great council, to sit and vote with the Lords of Session. When the Lord Chancellor (see CHANCELLOR OF SCOTLAND) was present, he was president of the Session.

His office was abolished at the Union, and the habit of appointing peers gradually fell into disuse, though, when a peer chances to be present, he is still, as a mark of courtesy, accommodated with a seat on the bench. From its foundation, till 1808, the C. of S. consisted of one court; in that year it was divided into what are known as the First and Second Divisions, two separate courts possessing co-ordinate jurisdiction. The Lord President is still president of the whole court when called together for consultation, and enjoys other privileges in that capacity; but on ordinary occasions, he officiates simply as president of the First Division. In 1810, another very important change was made. The First Division up to this time had consisted of 7, and the Second Division of 6 ordinary judges, the latter being presided over by the Lord Justice-clerk (q. v.), as the former was by the Lord President. The three junior judges were now taken from the First Division, and the two junior judges from the Second, and appointed to sit as permanent Lords Ordinary in the Outer House. The quorum, which had formerly been four, was now reduced to three in both Divisions. In 1830, the number of judges in the C. of S. was reduced to 13; and that is still the full number, though since 1877 there have actually been but 12 judges. Of the five Lords Ordinary, four only sit daily. The judgments of the Outer House, with a few statutory exceptions, are appealable to the Inner House. The youngest judge, or junior Lord Ordinary, officiates in a separate department of the Outer House, called the Bill Chamber (q. v.), where summary petitions, and other branches of business peculiarly requiring dispatch, are disposed of. This department alone is open during the vacations of the court, the judges, with the exception of the Lord President and Lord Justice-clerk, officiating in it in rotation. Either Division of the C. of S. may call in the aid of three judges of the other, when equally divided in opinion (31 and 32 Vict. cap. 100). In cases of still greater difficulty, the Lords Ordinary are also called in, and a hearing before the whole court, or *in presence*, as it is called, takes place. Since the 31 and 32 Vict. cap. 100, no hearings before the whole court have taken place; the cases being decided in written arguments submitted to the judges. The judges of the C. of S. are appointed by the crown, and hold their offices for life. No one is eligible to the office unless he has served as an advocate or principal clerk of session for five, or as a writer to the signet for ten, years. Practically, none but advocates are appointed. No action for debt can originate in the C. of S. in which the interest of the pursuer is less than £25. With few exceptions, the judgments of the inferior courts of Scotland are reviewable by the C. of S., but this rule does not apply to the small-debt courts. The judgment of the C. of S. may be appealed to the House of Lords within two years.

COURTALLUM, a town of the district of Tinnevelly, in the presidency of Madras, stands in lat. 8° 56' N., and long. 77° 20' E., near the junction of the Eastern and Western Ghauts. Open towards the east, at a height of 700 feet above the sea, it is elsewhere embosomed in hills, having, in its immediate neighborhood, a deep glen which affords easy communication between the opposite shores of Hindustan. The place is a favorite retreat for invalids, deservedly enjoying a reputation for salubrity of air, richness of vegetation, and beauty of scenery. The indigenous flora comprises 2000 species, and many exotics, such as the nutmeg, clove, and cinnamon, have been introduced with success.

COU'RTESY, or CURTESY, in Law, is the life interest which the surviving husband has in the real or heritable estate of the wife. It is remarkable that, both in England and in Scotland, this customary right should be regarded as a national peculiarity—that in England it should be called the C. of England, and in Scotland

the C. of Scotland—whereas it is well known to be peculiar to neither of them. Traces of it are to be found in a constitution of the Emperor Constantine (Code 6, 60, 1); and there can be no doubt that it had found a place, with all the peculiarities which now belong to it, in the *coutume* of Normandy, from whence there is every reason to think that it was transferred to England (Barnage, vol. ii. p. 60; Stephen's *Com.* vol. i. p. 264; Fraser's *Domestic Relations*, i. p. 635). The four circumstances which are requisite to make a tenancy by C. in England are—marriage, seizin of the wife, living issue, and the wife's death. The rule that the child must have been heard to cry, which at one time was followed in England, is still adhered to in Scotland. It is not necessary, however, in either country, that the child survive; it is enough that it was once in existence, although it should have died immediately after its birth. In both countries, the child must be the mother's heir, and it is consequently said that C. is due to the surviving husband rather as the father of an heir than as the widower of an heiress. By 19 and 20 Vict. c. 120, which enables tenants for life of *settled* estates (see SETTLED ESTATE) to make effectual leases for twenty-one years, subject to the exceptions and provisions in the act contained, a similar power is also conferred upon tenants by the C. of *unsettled* estates (Stephen, i. p. 267). As to the law of Scotland on the point, see Hunter on Landlord and Tenant, i. p. 119.

COURTESY TITLES. Titles of honor (q. v.) are imparted by the sovereign or other competent authority. Independently of these, there are C. T. assumed by or given to individuals, and which have no validity in law. The term C. T. is best known in connection with the titles given by popular consent to the sons and daughters of certain peers. English dukes, marquises, earls, and viscounts have several titles, accumulated by distinct patents in their progressive steps in the peerage. Thus, a duke may at the same time be a marquis, an earl, a baron, and a baronet; a marquis may be also an earl, &c.; and an earl is almost always a baron.

In ordinary parlance, they respectively take only their highest title. One of the inferior titles so set aside is permitted, as a matter of social dignity, to be assumed by the eldest son. For example, the Duke of Bedford being also Marquis of Tavistock, his eldest son takes the title of Marquis of Tavistock; and the Duke of Buccleuch and Queensberry being also Earl of Dalkeith, his eldest son takes the title of Earl of Dalkeith. When it happens that the inferior title is of the same name as the first, there is a somewhat different usage. For example, the Earl of Gosford being also Viscount Gosford, his eldest son, to prevent confusion, takes only the family surname, Acheson, with the prefix Lord—Lord Acheson. The younger sons of dukes and marquises have the courtesy title of Lord prefixed to their Christian and surname: as, for example, Lord Frederick Charles Cavendish, a younger son of the Duke of Devonshire; or Lord Archibald Campbell, a younger son of the Duke of Argyll. The eldest son of an earl, when not a viscount, takes his father's second title of Lord: as, for example, the eldest son of the Earl of Wemyss is styled Lord Elcho. A proper understanding of those conventional customs will serve to clear up some of the perplexities into which foreigners are apt to become involved in thinking of our highly artificial social system. It is to be kept in mind, that titles by courtesy do not raise their bearers above the rank of commoners; and that, consequently, they are eligible for election as representatives to the House of Commons. Very many of the peers, indeed, begin their political career as county or borough representatives under their C. T.; serving in this way a kind of apprenticeship as statesmen before they are advanced, by the decease of their fathers, to the House of Lords.

The daughters of dukes, marquises, and earls have the title Lady prefixed to their Christian and surname; and in the event of their marrying a person of inferior rank, they retain the title Lady with their Christian name, adding the surname of their husband. Yet, these are but courtesy titles. The only valid title they can claim in virtue of their birth is the prefix Honorable, which is applicable alike to the sons and daughters of peers. The wives of baronets receive the courtesy title of Lady; their lawful designation being Dame. Ladies who have had a title by a first marriage, retain it as a matter of courtesy when they are married a second time, though the alliance be with a person without a title—a circumstance sometimes leading to a certain awkwardness in designation. In Scotland, the eldest son of a baron has the courtesy title of Master. For example, the eldest son of Lord Elibank is styled Master of Elibank.

The title Right Honorable is given in some few instances by courtesy to officials, as in the case of the Lord Advocate of Scotland. The judges of the Court of Session in Scotland, on first taking their seat on the bench, assume the courtesy title of Lord along with their own surname or a territorial title.

But such titles are used only senatorially. In writing the real name is subscribed. The titles of Mr. or Master and Esquire (q. v.), are now given by courtesy to nearly all classes of persons. For an exact definition of titles by courtesy of members of the peerage, see the *Hand-book to the Desk*, or any good *Letter-writer*.

COU'RT-FOOL. From very ancient times there existed a class of persons whose business it was to while away the time of the noble and wealthy, particularly at table, by all manner of jests and witty sayings. Alexander the Great, Dionysius of Syracuse, Augustus and his successors, maintained such jesters. It was, however, during the middle ages that this singular and repulsive vocation became fully developed, and that the office of jester or fool became a regular and indispensable court-office. The symbols or such a personage were—the shaven head; the fool's cap of gay colors, with asses' ears and cock's comb; the fool's sceptre, which was variously formed; the bells, which were mostly attached to the cap, but likewise to other parts of the dress; and a large collar. The rest of the costume was regulated by the taste of the master. Of these professional fools, some obtained a historical reputation,

Court-fool and Buffoon.
From Harleian MS., fourteenth century.

as Triboulet, jester to King Francis I. of France, and his successor, Brusquet; Klaus Narr, at the court of the Elector Frederic the Wise of Prussia, whose jests have been repeatedly printed; and Scogan, court-fool to Edward IV. of England. The kings and regents in Scotland had their jesters, as was usual in their time; and the sarcastic sayings of some of these privileged personages—such as those of Patrick Bonny, jester to Regent Morton—are still remembered among the national *facetiæ*. English court-jesters died out with the Stuarts; one of the last of the race being the famous Archie Armstrong, whose death took place characteriscally, on April 1, 1646.

Besides the regular fools recognized and dressed as such, there was a higher class, called merry counsellors, generally men of talent, who availed themselves of the privilege of free speech to ridicule in the most merciless fashion the follies and vices of their contemporaries. Of these, Kunz von der Rosen, jester to the Emperor Maximilian I.; John Heywood, a prolific dramatic poet and epigrammatist at the court of Henry VIII.; and Angely, a French courtier, were particularly distinguished for talent and wit. In all times, there existed at courts persons who, without becoming jesters by profession, were allowed the privilege of castigating the company by their witty and satirical attacks, or who served as the general butts. Among these were, on the one hand, the Saxon general Kyau, celebrated for his blunt jests; and on the other, the learned Jacob Paul, Baron Grundling, whom Frederic William I. of Prussia, to show his contempt for science and the artificial court system, loaded with titles. Flögel's and Nick's German treatises on this subject, and Dr. Doran's *History of Court Fools*, are interesting works. Such a history forms a kind of barometer of the manners and morals of courts at different times. At a later period, imbecile or weak-minded persons were kept for the entertainment of the company. Even ordinary noblemen considered such an attendant indispensable; and thus the system reached its last stage, and towards the end of the 17th and beginning of the 18th century, was finally abolished. It survived longest in Russia, where Peter the Great had so many fools that he divided them into distinct classes.

COU'RT-HAND, a name given in England to the old, Gothic, or Saxon handwriting, as distinguished from the modern or Italian handwriting. The old way of writing continued to be used in the law-courts after it had been superseded elsewhere, and hence its name of Court-hand.

COURT-MA'RTIAL, a court for the trial of any one belonging to the army or navy, for some breach of military or naval law. The members of the court fill the functions both of judge and jury. In the British army, courts-martial are *general*, *district*, or *regimental*. The first is the only one of the three empowered to award death or transportation for life, as a punishment to the offending person. It consists of thirteen commissioned officers, if so many can be obtained at the time and place; and a deputy judge-advocate is specially appointed to conduct the prosecution. A non-commissioned officer, or a private, may be tried by any one of the three kinds of court; but a commissioned officer only by a general court-martial. A *district* or *garrison* C. may be convened by a field-officer commanding a district or corps, without requiring the sovereign's sign-manual.

It consists of a number of members, varying from three to seven, with a captain or higher officer to act as deputy judge-advocate. Such a court tries warrant officers, non-commissioned officers, and rank and file; and can only treat such offences, or alleged offences, as meet with secondary punishment. A *regimental* C. may be convened by the commanding officer of a regiment or detachment; it consists of three or more members; it treats of minor offences, and can award only minor punishments.

In all these kinds of C. the members are sworn in; the court is an open or public one; the vote or sentence is decided by majority, the junior members voting first; but two-thirds of the whole number, in a general C., are necessary to give validity to a sentence of death. Before execution, the sentence of every military court-martial has to be approved and confirmed by the convening authority.

Sometimes *Courts of Inquiry* are held instead of a C., not to try or to punish, but to make an investigation; the members not being on oath. Such a court occasionally precedes a court-martial.

Naval courts-martial consist of admirals, captains, and commanders, who try for offences against the naval articles of war. The chief admiral of the fleet or squadron appoints the members; but all captains have a *right* to sit, if not implicated. The C. is open to all the crew and others as spectators. The sentence is final, and needs no confirmation.

COURTRAI (Flemish *Kortryk*), a town of Belgium, in the province of West Flanders, about 30 miles south of Bruges, lat. 50° 49′ N., long. 3° 18′ E. C., which is built on both sides of the Lys, is surrounded with walls, and has a castle, a citadel, a fine old bridge flanked with Flemish towers, a noble town hall, and a beautiful Gothic church, founded in 1238 by Baldwin, Count of Flanders. Though a busy manufacturing place, C. is nevertheless very clean. Table damask and other linen are the principal articles of manufacture. There are extensive bleaching-grounds in the vicinity, and the neighboring plains supply fine flax in large quantities to many European markets. Pop. (1880) 26,943. In 1302 the Flemings, citizens of Ghent and Bruges chiefly, won a splendid victory over the chivalry of France beneath the walls of C., more than 700 gilt spurs (worn only by French nobles) being afterwards gathered from the dead by the victors. The battle was hence named 'the Battle of the Spurs.'

COU'RT-YARD. See FARM BUILDINGS.

COUSIN, VICTOR, the founder of systematic eclecticism in modern philosophy, was born in Paris, November 28, 1792. He studied with brilliant success at the *Lycée Charlemagne*. In 1812, he was appointed Greek tutor in the *Ecole Normale*, and in 1814, Examiner in Philosophy. In the following year he became assistant-professor to Royer-Collard at the Sorbonne, and threw himself heartily into that reaction against the sensualistic philosophy and literature of the 18th c., which was then the order of the day. Following the path of his senior, he became an exponent of the doctrines of the Scotch metaphysicians, but exhibited far more brilliancy, energy, and warmth of expression than the original authors of these doctrines. In 1817, C. visited Germany, where he was introduced to bolder and more speculative systems of philosophy than any he had yet known. He studied successively, or at the same time, Plato, Kant, Jacobi, Fichte, and Schelling. A second visit to Germany, in 1824—1825, had also important consequences. Suspected of carbonarism, he was arrested at Dresden by the police, and sent to Berlin, where he was detained for six months. He took advantage of his compulsory residence in the capital of Prussia to study the philosophy of Hegel, which exercised considerable influence on his susceptible intellect. On his return to France, he took a decided stand against the reactionary policy of Charles X.; and in 1827, when the comparatively liberal ministry of Martignac came into office, C., who had for some years been suspended from his professorial functions, was reinstated in his chair. Meanwhile, C. had appeared as an author. During 1820—1827, he published his editions of Proclus and Descartes, and part of his celebrated translation of Plato, which was finished in 1840, in 13 vols. The year 1828 witnessed the most splendid triumph in the career of C. as a philosophic teacher. It is said that to find an audience as numerous, and as passionately interested in the topics discussed, as gathered round C., it would be necessary to go back to the days of Abelard and other medieval teachers of philosophy. C. was still young, simple, and pure in his habits; his doctrines were for the most part new to his hearers, bold, and in harmony with the spirit of the time. The finest qualities of the national genius appeared in his lectures, a wonderful lucidity of exposition, an exquisite beauty of style such as no modern or ancient philosopher, excepting Plato, has equaled; a brilliancy of generalization and criticism that enchanted every one; and a power of co-ordinating the facts of history and philosophy in such a manner as to make each illustrate the other, and reveal their most intricate relations. At this period, C. was one of the most influential leaders of opinion among the educated classes in Paris; and consequently, after the revolution of 1830, when his friend Guizot became prime-minister, C. was made a member of the Council of Public Instruction; in 1832, a peer of France; and later, Director of the *Ecole Normale*. His efforts for the organization of primary instruction are to be seen in those valuable reports which he drew up, from personal observation, on the state of public education in Germany and Holland.

In 1840, he was elected a member of the *Académie des Sciences Morales et Politiques*, and in the same year became minister of Public Instruction in the cabinet of Thiers. The revolution of 1848 found in C. a friend rather than an enemy. He aided the government of Cavignac, and published an anti-socialistic brochure, called *Justice et Charité*. After 1849, he disappeared from public life, and died in 1867.

It is more easy to state what philosophical doctrines have received exposition at the hands of C., than to determine precisely what are his own. At first a disciple of Royer-Collard and the Scotch school, he was attached to the psychological method of investigation; afterwards a keen student of the German school, he expounded the views of Shelling with such copious enthusiasm, that he might legitimately enough have been considered a thorough Pantheist. Judging from such a book as *Du Vrai, du Beau, et du Bien* (1853), he seemed more disposed, latterly, to regard philosophy in its religious and æsthetic relations. See ECLECTICISM.

C.'s chief works (besides those already mentioned) are *Fragments Philosophiques* (1826), *Cours de l'Histoire de la Philosophie* (1827), *Ouvrages inédites d' Abelard* (1836), *Cours d'Histoire de la Philosophie Morale au XVIII^e Siècle* (1840—1841), *Leçons de Philosophie sur Kant* (1842), *Des Pensées de Paschal* (1842), *Etudes sur les Femmes et la Société du XVIII^e Siècle, &c.* (1853). C. also contributed a great variety of papers to the literary and philosophic Reviews of France.

COU'SINS, FIRST. See MARRIAGE.

COUTANCES, a town of France, in the department of La Manche, at the confluence of the Soulle and Bulsard. It is built on a conical hill, a few miles from the English Channel, and is a somewhat lugubrious place. Its cathedral, however, is one of the finest specimens of ecclesiastical architecture in the early pointed style in Normandy. One of the towers of the edifice is lighted up with a lantern, that serves as a beacon for ships navigating the channel. C. has manufactures of druggets, muslins, &c., and a trade in corn. Pop. (1876) 8008.

COUTHON, GEORGES, a fanatic of the French Revolution, was born in 1756 at Orsay, near Clermont, in Auvergne. At the outbreak of the Revolution, he was engaged as an advocate, and in 1790 was elected president of the Tribunal for the district of Clermont. In 1791, he was sent by his fellow-citizens to the National Convention, where he made himself conspicuous by his furious hatred of the court, the priesthood, and the monarchy. In spite of an infirmity which prevented him using his limbs, C. soon became very influential from the rabid violence of his sentiments. He voted for the death of the king without delay or appeal to the country, and (after a brief relapse into moderatism) became a devoted and bloothirsty partisan of Robespierre. In July 1793, he was appointed a member of the *Comité de Salut Public*, and along with Châteauneuf-Randon and Maignet, was sent against the Lyonnese insurgents. After some opposition, the city was taken, when a multitude of the citizens were put to death.

On his return to the Convention, he became quite maniacal, demanding the 'impeachment' of all the kings of the earth, and voting for Pitt being declared 'the enemy of the human race,' and the English nation a 'traitor to humanity.' The fall of Robespierre brought down C. also. Accused by Fréron, he was thrown into prison, delivered by the mob with whom he was popular, recaptured by the soldiers of the Convention, and executed 28th July 1794, along with St. Just and Robespierre.

COUTRAS, a town of France in the department of Gironde, situated on the left bank of the Dronne, about 26 miles north-east of Bordeaux. C. has a considerable trade in flour, and the district produces red wine; but the place is known principally on account of the bloody victory gained here (1587) by Henry of Navarre over the forces of the League. In this battle the Duc de Joyeuse,

commander of the Leaguers, was slain, as well as many other great noblemen on the same side. Pop. (1876) 2202.

CO'VENANT, in English Law, an agreement by *deed* (q. v.). In the common law-courts, a special form of action is appropriated to the enforcement of a C. called an Action of Covenant. But in many cases it may also be enforced by the form called an Action of Debt. A C. may also be *implied*. 'Covenant running with the land,' is a C. affecting the land into whosesoever hands it comes.

COVENANT (Lat. *convenire*, to come together), a contract or agreement; a term much used by theologians, and in its ordinary signification, as well as in its theological use, nearly if not always exactly equivalent to the Hebrew *berith* of the Old Testament and the Greek *diatheke* of the New. Applied to relations established between God and men, the term C. must be understood with a certain modification of the meaning which it bears when employed concerning the relations of men to one another, when two independent parties enter into a C., which they have equal right to make or to refuse to make; and is sometimes employed as equivalent to *dispensation*, and the Jewish dispensation is called the *Old* C. (or *testament*, by another translation of *diatheke*), in contradistinction to the Christian, which is called the *New*. God, in his supremacy, is regarded as appointing certain conditions for his creatures, which they cannot but accept, yet their willing consent to these conditions gives to the relation established the nature of a C.; and thus God is commonly said to have made two covenants with man: the *first C.*, or *C. of Works*, with Adam, as the representative of the whole human race, promising life (with perfect happiness), upon condition of perfect obedience, whilst death was threatened as the penalty of transgression; the *second C.*, or *C. of Grace*, being that on which depend the whole hope and salvation of man, since the first C. was broken, and in which life is freely offered to sinners, and they are simply required to believe in Jesus Christ that they might be saved.

This C. God is regarded as having made with Christ, as the representative of his people, and with them in him. The older theologians often speak of the *C. of Redemption* between God and Christ, employing the term of *C. of Grace* rather to designate the whole dealings of God with men in giving effect to the C. of Redemption; but the term *C. of Grace* has long been almost universally employed to include all that was comprehended under both terms. The *Abrahamic C.* is the C. of Grace as declared to Abraham, in its particular relation to him and his seed. God is represented in Scripture as sustaining a *C. relation* to his *own people*, to the Jews under the Old C., to believers in Christ under the New; and doctrinal theology consists not a little in tracing out the nature of this relation, and the consequences which flow from it. As the people of God collectively sustain a C. relation to him, so do believers individually; and it has not been an uncommon thing for pious persons to endeavor to reduce to writing their sense of this '*C. obligation*,' under the notion of a *personal covenanting* with God; and of binding themselves by a stronger obligation to what they believed to be good and their duty. It has also been common for men, from the earliest ages, to enter into covenants with one another with more or less of religious solemnity; and this has in particular been done among those who have suffered persecution, or have been engaged in contests concerning matters of religion, for which the authority of certain passages of the Old Testament is strongly pleaded. Instances occur in the history of the Waldenses, and of some of the Reformed churches, particularly in the history of the Reformation in Scotland. But the most memorable covenants in Scottish ecclesiastical history belong to a period subsequent to the Reformation.

COVENANTS, THE, known in Scottish history and tradition, are chiefly two in number—the NATIONAL COVENANT, and the SOLEMN LEAGUE AND COVENANT. As it is necessary to discriminate between these, we shall speak of them separately.

NATIONAL COVENANT.—This was a bond of union or agreement, drawn up at Edinburgh in 1638, by the leading Presbyterian ministers, and subscribed by vast numbers of persons of all ranks of life. It embodied the confession of Faith of 1580 and 1581, subscribed by James VI. in his youth, and again recognized in 1590 and 1596; and was binding on all who signed it to spare nothing which might save their religion. The proximate cause of this extraordinary manifestation of feeling was an attempt of Charles I. to enforce Episcopacy and the use of the Service-book in Scotland.

The subscribing of the National Covenant began on the 28th of February 1638, in the Greyfriars' church and churchyard, at Edinburgh. Numerous copies were also circulated through the country for signature—a circumstance which accounts for many copies being still extant. 'In the Library of the Faculty of Advocates at Edinburgh are preserved five parchment copies, with the original signatures of Rothes, Montrose, Loudon, and many others of the nobility, gentry, commissioners of counties and burghs, and ministers, though only one of these five copies is apparently connected with the first signing, and the other four, which are dated 1639, were subscribed after the ratification by the General Assembly.'—*Historical Sketch Illustrative of the National Confession of Faith* (Davidson, Edinburgh, 1849), to which we refer for a variety of details. The General Assembly which met at Glasgow, November 21, 1638, ratified the National Covenant and the Confession of Faith which it embraced, and deposed the whole of the hierarchy which had been established by Charles I. The National Covenant was subsequently ratified by the 5th act of the second parliament of Charles I., held at Edinburgh June 11, 1640, and subscribed by Charles II. at Spey, June 23, 1650, and Scoon, January 1, 1651. The document will be found in the volume which comprehends the *Westminster Confession of Faith*, in use by the Church of Scotland. Those who subscribe the National Covenant, promise to 'continue in obedience of the doctrine and discipline of this kirk.' They also give assent to various acts of parliament in the reign of James VI., which, besides repudiating the jurisdiction of the pope, and all the ceremonial observances and errors of the Romish Church, ordain 'all sayers, wilful hearers, and concealers of the mass, the maintainers and resettors of the priests, Jesuits, trafficking Papists, to be punished without any exception or restriction.'

SOLEMN LEAGUE AND COVENANT.—This was a document of date four to five years later than the National Covenant, since the signing of which, Charles I. had broken with the English parliament, set up his standard at Nottingham (August 1642), and from his various successes, it was thought he might finally be able to reinstate Episcopacy in Scotland. With some alarm on this ground, the Scotch willingly received overtures from commissioners deputed from the English parliament. Hopes were held out to the Scottish nation, that in the event of success against the king, the Presbyterian model should supersede the Episcopalian both in England and Ireland. Approving of a measure of this kind, the Scottish Estates entered into what was called a Solemn League and Covenant with the English parliament. One of the provisions of the bond of agreement was, that the Scotch should send an army into England against the king, which they did in January 1644.

The Solemn League and Covenant was subscribed by many of all ranks in Scotland and England, including the Assembly of Divines at Westminster, was ratified by the General Assembly at Edinburgh, August 17, 1643, and the Scottish parliament, July 15, 1644; and subscribed by Charles II. at Spey, 1650, and Scoon 1651. Like the National Covenant, it has, till the present day, a place in the volume which comprehends the *Westminster Confession of Faith* of the Church of Scotland. While the National Covenant refers to the observance of the Presbyterian polity within Scotland alone, the Solemn League and Covenant is much more comprehensive. Those who subscribe it, setting out with a profession of attachment to the Church of Scotland, are to endeavor to bring about a uniformity in religion and church-discipline in the three kingdoms; and further—'That we shall in like manner, without respect of persons, endeavor the extirpation of popery, prelacy (that is, church-government by archbishops, bishops, their chancellors, and commissaries, deans, deans and chapters, archdeacons, and all other ecclesiastical officers depending on that hierarchy), superstition, heresy, schism, profaneness, and whatsoever shall be found to be contrary to sound doctrine and the power of godliness, lest we partake in other men's sins, and thereby be in danger to receive of their plagues; and that the Lord may be one, and his name one, in the three kingdoms.'

Such were the famous covenants at one time enforced by civil penalties, and for which their adherents, under the name of Covenanters, fought and suffered in Scotland, between the Restoration and Revolution, maintaining to the last that both Covenants, notwithstanding certain rescissory acts of Parliament, were still binding on the whole nation. At the Revolution, the two Covenants were set aside, and cannot be said to have now any practical effect in any part of the United Kingdom. As above stated, they have a place in the volume which comprehends the *Westminster Confession of Faith*, but for what reason, it is difficult to say; for the Church of Scotland does not make adherence to them obligatory on either clerical or lay members. Certain Scottish and Irish dissenters, however, still profess attachment to the Covenants, and on particular occasions renew their subscription of them. See CAMERONIANS. The obligations undertaken by the sovereign, and the modern acts of parliament abolishing religious tests on taking civil office, and admitting Roman Catholics, Nonconformists, and Jews to parliament, not to speak of public opinion are totally at variance with the Covenants. It is customary in popular lectures on the Covenanters to overlook the fact, in compassion for their sufferings, that they contended for what is now quite adverse to the principles of religious toleration. Yet, in so far as the manful struggle in which they were concerned helped to accelerate the revolution, the history of the Covenanters must be associated with that of civil and religious liberty.

CO'VENT GA'RDEN (properly *Convent Garden*, from having been originally the garden of Westminster Abbey) is a square in London celebrated for its great market of fruit, vegetables, and flowers. In the 17th c., C. G. was a very fashionable quarter of the town—the residence of many eminent persons. The scene of one of Dryden's plays is laid here, and frequent allusions are made to the place in plays of Charles II.'s time. The market, now so famous, appears to have originated about 1656 in a few wooden sheds and stalls. C. G. is for a stranger one of the sights of London, and is seen to greatest advantage about three o'clock on a summer morning; Tuesday, Thursday, and Saturday being the principal days.

CO'VENTRY (Convent Town), a city, parliamentary and municipal borough, and manufacturing town in the north of Warwickshire, on the Sherbourne, an affluent of the Avon, 18½ miles east-south-east of Birmingham. It stands on a gentle eminence in a valley, with a ridge of hill on the south, and contains many old houses, with timbered fronts, projecting into narrow streets, and belonging to the 15th and 16th centuries. The modern part of C., however, is well, though not regularly built. The chief buildings are the churches, with imposing spires. St. Michael's Church, built 1313—1395, is said to be the largest church in England, and is one of the noblest of the lighter Gothic structures. St. Mary's Hall, built 1450, for the Guild, is one of the finest specimens of ornamental work in England, with grotesque carved oak roof, ancient tapestry, and great painted window. In the market-place formerly stood a rich hexagonal Gothic cross, 57 feet high, erected in the 16th c. in three stories, with exquisitely finished pillars, pinnacles, and niches, with statues of English kings and saints. Before the year 1760, the cross had fallen to decay, and in 1771, the remains of it were taken down and removed. The ancient walls, three miles in circuit round C., were demolished by Charles II. Pop. (1871) of mun. bor. 37,670; (1881) 42,111. C. returns two members to parliament. The chief manufactures are ribbons and watches. There are large silk-dyeing works. C. is nearly in the center, between the four great English ports, London, Bristol, Liverpool, and Hull, and has extensive canal communication with other parts of the country. It is a very ancient place. In 1044, Earl Leofric and his wife, Lady Godiva, founded here a magnificent Benedictine monastery. In memory of Godiva (q. v.), who is said to have ridden round the town naked, to free it from certain imposts laid on by her husband, curious and splendid processions were formerly held in C. In the 15th c., religious mysteries or plays were often acted here by the Grey Friars before kings. Henry VIII. demolished the beautiful cathedral of C. Here occurred the famous meeting for the intended trial by battle between the Dukes of Norfolk and Hereford, immortalized in Shakspeare's *Richard II.* Two memorable parliaments were also held in the monastery of C. in the 15th century.

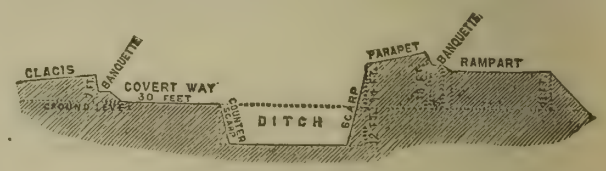
The one contained no lawyers, while the other passed many attainders against the Duke of York, &c. In the 15th, 16th, and 17th centuries, C. was famous for woollens, broadcloths, caps, and blue thread bonnets. The Lammas Land lying around C., and comprising about 1100 acres, was not long ago divided between the proprietors and the freemen, numbering about 4000, in the proportion of about two-thirds to the former, and one-third to the latter. C. was visited by the plague six times between 1350 and 1625. The phrase, 'to send to Coventry,' took its rise most probably from the derivation of the name C., and meant 'to send to a convent;' i. e., to shut out from society.

COVENTRY, SIR JOHN, has obtained a niche in English history from accidental circumstances. In the month of October 1670, he rose in parliament and asked a question relative to a measure before the House, which was taken as an unwarrantable reflection on the king's amours. Charles was furious, and sent some of his guards to watch in the streets where C. lived, and leave a mark upon him. C. was attacked one night, and had his nose cut to the bone. Parliament took notice of this atrocious outrage, and passed a bill known by the name of the COVENTRY ACT, making cutting and maiming a capital offence; but they had not courage sufficient to bring the king's bravoes to trial.

CO'VERDALE, MILES, an eminent English divine, was born in Yorkshire in 1487. He was educated at Cambridge by the Augustin friars, and becoming an Augustin monk, was ordained at Norwich. He appears, however, to have soon changed his religious opinions, and to have devoted himself earnestly to the work of the Reformation. Being abroad in 1532, he assisted Tyndale with his translation of the Scriptures, and three years afterwards appeared his own translation of the Bible, with a dedication by himself to Henry VIII. This was the first English Bible sanctioned by royal authority, as, indeed, it was the first complete translation of the Bible printed in the English language. The Psalms of this translation are those still used in the Book of Common Prayer. In 1538, C., with the consent of King Henry VIII., and with the permission of Francis I., went to Paris to superintend another English edition of the Scriptures, his reason for going to Paris being that paper and workmanship were there cheaper and better than in England.

The inquisition, however, notwithstanding the royal license of Francis, interfered, seized the whole impression, consisting of 2500 copies, and condemned them to the flames. But through the cupidity of one of their executive officers, who sold a considerable number of the heretical books to a haberdasher as waste paper, some copies were saved and brought to London along with the presses, types, &c., which had been employed in printing them. Several of the workmen also came over to London; and Grafton and Whitchurch, the noted printers of that day, were thus enabled to bring out in 1539, under C.'s superintendence, the *Great Bible*, commonly called *Cranmer's Bible*, on account of that prelate having written a preface to it. In 1551, C. was appointed to the see of Exeter, the duties of which high ecclesiastical office he discharged with great zeal, until the accession of Mary in 1553, when he was ejected, and thrown into prison, from which he was only released after two years' confinement, on the earnest intercession of the king of Denmark, whose interest was evoked by his chaplain, C.'s brother-in-law, and on the condition that he should leave the country. C. went to Denmark, and subsequently to Geneva, where he assisted in producing the *Geneva Translation* of the Scriptures (1557—1560). On the accession of Elizabeth, he returned to England, but certain notions concerning ecclesiastical ceremonies imbibed at Geneva operated against his preferment in the church; and it was not until 1564 that he was collated to the rectory of St. Magnus, London. Owing to age and infirmities he resigned this living in 1566, and died in about two years afterwards. C. was the author of several tracts designed to promote the Reformation, and made various translations from the works of the continental reformers. The tri-centenary of the issue of his Bible was celebrated throughout the English Church, October 4, 1835, and medals were struck in honor of the occasion.

CO'VERT WAY, or COVERED WAY, in Fortification, is a road or broad path outside the ditch of a fortified place, between the counterscarp and the glacis. It is about 30 feet wide, and is sunk so far below the crest of the glacis, that soldiers standing



Vertical Section of Defence-works.

upon it cannot be seen by the besiegers; hence the name of covert or hidden way. Sentinels, placed in the C. W., prevent all access of the enemy's spies to examine the ditch; and when musketeers mount on the banquette or raised platform on the side next the glacis, they can pour out a grazing fire on the enemy over the crest. The C. W. is broad enough to allow bodies of troops to form on it, either to act defensively or to make sorties; and to increase this accommodation, enlarged portions, called *places of arms*, are made at certain spots.

In the annexed cut, representing a vertical section of the whole range of defence-works, from the *rampart* next the city to the *glacis*, the relation between the *C. W.* and the other works is clearly shown. The *banquette* of the C. W. is here shown to be about 3 feet high by 4 wide, and reached by a sloping ascent of 4 feet. A ground or horizontal plan of the C. W. is shown in the woodcut annexed to CURTAIN.

COVILHA', a town of Beira in Portugal. Pop. (1878) 10,986, who manufacture a brown cloth.

CO'VINGTON, a city of Kentucky, U.S., on the south bank of the Ohio River, and west of the mouth of Licking River, opposite Cincinnati, with which it is connected by a lofty suspension-bridge and steam-ferries. It has a city hall, 25 churches, the Western Theological College, a Roman Catholic cathedral, and manufactories of cotton, hemp, silk, tobacco, and iron. There are also several establishments for packing pork and beef. Pop. (1860) 16,471; (1870) 24,505; (1880) 29,720.

COW. See Ox, DAIRY.

COW PA'RSNIP (*Heracleum*), a genus of plants of the natural order *Umbelliferæ*, having petals bent in at the middle, and flat compressed fruit. One species only is a native of Britain, the Common C. P. or HOG-WEED, called *Kiesh* in Scotland; a common and rank weed, with coarsely hairy leaves, and stem about 3—5 feet high. It is gathered in some parts of England for fattening hogs, and is said to afford wholesome food for cattle. Some Siberian species are much larger, and have been recommended for cultivation on account of the great quantity of herbage which they yield very early in the season, particularly *H. panaces*, which

sometimes attains a height of 10 feet, and the root leaves are 3—5 feet long.

Cow Parsnip Flower.

Cow Parsnip Fruit.

COW PLANT (*Gymnema lactiferum*), a perennial plant of the natural order *Asclepiadaceæ*, a native of Ceylon; with erect stem, ovate leaves, and very short umbels; which has acquired a factitious celebrity from the statement made and often repeated that its milky juice is used as a substitute for milk, and that its leaves are boiled to supply the want of cream! But this, according to Sir J. E. Tennant, is altogether a mistake, and the name is derived merely from the appearance of the juice.

COW TREE, a name given to a number of species of tree of different natural orders, the bland milky juice of which is used instead of milk. They are all natives of tropical countries, and mostly belong to natural orders in which acridity is the general characteristic of the milky juice. Some of them belong to the natural order *Moraceæ*, and are closely allied to the Fig; others to the natural order *Artocarpaceæ*, one of which is the famous PALO DE VACA or C. T. of the Cordilleras and Caraccas (*Galactodendron utile*, now rather referred to the genus *Brosimum*, see BREAD-NUT). Another is the HYA-HYA (*Tabernæmontana utilis*), a native of equatorial America, belonging to the natural order *Apocynaceæ*.

Cow Tree (*Galactodendron utile.*)

Fruit of Cow Tree.

The PALO DE VACA grows in rocky situations, at an elevation in equatorial regions of about 3000 feet. It is a lofty tree, with laurel-like leaves, 10—16 inches long, and very small flowers. For several months in the year, not a shower moistens its foliage, and its branches appear dead; but as soon as the trunk is pierced there flows from it a copious stream of sweet and nourishing milk. The milk flows most freely at sunrise. The natives are then to be seen hastening from all quarters with bowls to receive it. The milk has an agreeable odor and a viscidity which does not belong to the milk of animals; it becomes yellow in a short time, and thickens or forms a sort of cream at the surface, which gradually thickens into a cheesy consistency before it begins to putrefy. This milk is nutritious, and is much used by the negroes and Indians; but differs very materially in its composition from the milk of animals; more than half being wax and fibrin; a little sugar, a salt of magnesia, and water, chiefly making up the rest.

The HYA-HYA also yields a copious milky juice, which is used in Demerara and elsewhere as a substitute for milk, and is very agreeable and nutritious.

COW'AGE, COW'HAGE, or COW'ITCH, consists of short, slender, brittle hairs, which grow on the outside of the pods of plants of the genus *Mucuna*, natives of the tropical parts of America and Asia. This genus belongs to the natural order *Leguminosæ*, suborder *Papilionaceæ*, and has a knotted, two-valved pod, divided by transverse partitions. The species are twining plants, shrubby or herbaceous, with leaves of three leaflets. That which yields most of the C. brought to Europe is *M. pruriens*, a native of the West Indies, with racemes of fine purple flowers, which have a disagreeable alliaceous smell, and pods about four inches long. *M. prurita* of the East Indies, and *M. urens*, the Ox-eye Bean of the West Indies, yield C. of similar quality. The hairs readily stick in the skin, and cause intolerable itching. C. is used in medicine, acting mechanically in killing and expelling worms, particularly the species of *Ascaris* (q. v.). That it does not act on the inner surface of the intestinal canal, is supposed to be owing to the mucous secretion. It is generally administered in syrup, treacle, or honey.—Before the pods of C. plants are ripe, they are used as a vegetable like kidney-beans, and are very palatable.

COW'BANE. See HEMLOCK.

COW'BERRY. See WORTLEBERRY.

COW'BRIDGE, a municipal and parliamentary borough in the south of Glamorganshire, on the Ddaw, 12 miles west of Cardiff. It chiefly consists of one long and wide street. It once had walls with three gates, built in the end of the 11th century. One of the gates, a Gothic structure, still remains. Pop. (1871) 1134. With Cardiff and Llantrissant, it returns one member to parliament.

COWES, WEST, a seaport and watering-place in the north corner of the Isle of Wight, on the west side of the mouth of the estuary of the Medina (here a third of a mile broad). It stands on a hill slope, and has a striking aspect from the sea. There are many elegant villas in the vicinity. C. has much trade, being the port of the Isle of Wight. It has daily steam communication with Southampton, from which it lies 10½ miles to the south-south-east, and with Portsmouth, from which it lies 11 miles to the west-south-west. At the angle formed by the Medina and the sea, is a small battery built by Henry VIII. C. is the head-quarters of the Royal Yacht Squadron and Club, who hold their annual regatta here. Pop. (1871) 5730; (1881) 6487. In 1880, 15,211 vessels, of 1,093,673 tonnage, entered the port.—EAST COWES is situated on the east side of the mouth of the Medina, and 2 miles north-west of Osborne House, the marine residence of Queen Victoria. Pop. (1871) 2058; (1881) 2615.

COW'LEY, ABRAHAM, was born in London in 1618. He was the son of a grocer, and was educated at Westminster School and Trinity College, Cambridge. According to his own statement, he was made a poet by the perusal of Spenser, whose works were wont to lie in his mother's parlor. A volume of poems, entitled *Poetic Blossoms*, was published by him at the age of 15, and one of the pieces contained therein was written when he was 10 years old.

At Cambridge he obtained distinction through the elegance of his translations; and while there, he composed the greater part of the *Davideis*, an epic in four books—a work which he never completed. He was attached to the court party, and, in consequence, was ejected from his college in 1643, after he had taken his degree of M.A. In 1646, he followed the queen to Paris, in which city he remained ten years; and on his return to England, being under suspicion, he was seized and bound in heavy securities for his future behavior. In the same year, he published an edition of his poems, with a preface, in which certain passages appeared, supposed to have a political bearing, which were suppressed in subsequent editions. After the Restoration, he expected to obtain the mastership of the Savoy, but was disappointed. He subsequently obtained a lease of the queen's lands at Chertsey, in Surrey, whither he retired in 1665, He died in July 1667, in his 49th year, and was buried in Westminster Abbey, near Chaucer and Spenser. In 1675, a monument was erected to his memory by the Duke of Buckingham.

Although almost forgotten now, the time was when C.'s poetry was considered equal to Shakspeare's or Spenser's. It certainly possesses merits of ingenuity and verbal brilliancy. He is often splendid, but it is the splendor of the rocket rather than of the glowworm or the star. His prose is more natural than his verse, and some of its passages reach a stately eloquence, reminding the reader of the magnificent prose of Milton.

COWLEY, HENRY RICHARD WELLESLEY, first Earl (his father being first Baron Cowley, better known as Sir Henry Wellesley), an English diplomatist of liberal opinions, was born in 1804. He early devoted himself to diplomatic pursuits. An attaché at Vienna in 1824, he was afterwards successively promoted to be secretary of the legation at Stuttgart, and to the embassy at Constantinople. Having acted as minister-plenipotentiary to Switzerland, and afterwards to Frankfurt, he was (1851) appointed minister to the Germanic Confederation, and in the following year he succeeded the Marquis of Normanby as ambassador at Paris. For this position he displayed eminent qualifications, and held the appointment whether his party was in or out of office till 1867, when he resigned. Along with the Earl of Clarendon he represented Great Britain at the Paris Congress of 1856; and it was

greatly owing to his tact and temper that ill-feeling between the two countries did not result in more serious disagreement. He was created Viscount Dangan and Earl Cowley in 1857, and made a K.G. in 1865.

COW-PEN BIRD (*Molothrus pecoris*), also called Cow Bird, Cow Troopial, Cow Blackbird, Cow Bunting, &c., a bird nearly allied to the Baltimore Birds and Troopials, having a short conical beak, and remarkable for its habit of depositing its eggs, like the cuckoo, in the nests of other birds. It is a native of North America, common in some of the southern States in winter, and migrating northward in spring. Great flocks are sometimes seen together.

The C. B. is about seven inches in entire length, of glossy brownish black plumage. It derives its name from its frequenting cowpens, to feed on the insects contained in, or attracted by the dung. It selects for the reception of its eggs the nests of birds smaller than itself, and by an interesting provision of nature, its egg, which is not much larger than theirs, is hatched sooner, and theirs appear to be generally removed as addled eggs.

COW'PER, WILLIAM, an English poet, was born on the 26th November 1731, in the parsonage house of Great Berkhamstead. His father, who was chaplain to George II., married Ann, daughter of Roger Donne, Esq. of Ludham Hall, in Norfolk. This lady expired in childbirth in 1737, leaving two sons, William, the poet, and John. This event made a deep impression on C.'s mind; and the lines addressed to his mother's portrait have drawn more tears than any other poem in the English language.

C. was a delicate and sensitive child, and boyhood brought with it only deeper melancholy and depression. At the age of six he was placed at a considerable school, kept by a Dr. Pitman, in Market Street, Hertfordshire. The period he spent here was very miserable, and laid the foundation of that settled gloom which oppressed him till death. It is to the remembrance of these wretched days that we are indebted for the fierce invective that burns in the somewhat one-sided *Tirocinium, or a Review of Schools*. C. completed his studies at Westminster School, and shortly after was articled to a Mr. Chapman, an attorney in London.

After completing his three years' articles with Mr. Chapman, C. went, in 1752, to reside in the Middle Temple. In 1754 he was called to the bar, but never practised. His father died in 1756, and left him a small patrimony. In 1759 he removed to the Inner Temple; and although at this period he expected to secure some legal appointment through the influence of his family, he hated law with a perfect hatred, and seldom opened a book that bore on his profession. Yet he was industrious enough: he scribbled poetry, read Homer, and, in conjunction with his brother, translated some of the books of the *Henriade*. Soon after his settlement in the Inner Temple, he was appointed a Commissioner of Bankrupts; but there is no reason to believe that he ever entered on the duties of his office. An influential relative now offered him the office of Clerk of the Journals of the House of Lords, which was accepted; but he, having to undergo an examination at the bar of the House, was seized with nervousness, and could not appear. At this period his misery was so great, that he meditated suicide, but fortunately failed to carry out his intentions for want of courage. In December 1763 he was removed to the house of Dr. Cotton at St. Albans—a prey to the deepest remorse.

C.'s pecuniary means had suffered considerably by the loss of his appointments, but his friends contrived to make up an income sufficient for his wants. After his removal from St. Albans, he went to reside in the town of Huntingdon. Here he formed acquaintance with Mrs. Unwin, the Mary of his poems—an acquaintance which ripened into the deepest friendship, and which subsisted till death. He went to reside with the Unwins, and enjoyed much tranquil happiness under that religious roof. When on a visit in January 1773, to the Rev. Mr. Newton, a friend of the Unwins, and a man of sincere piety, but, from the peculiar cast of his religious views, perhaps not the best physician 'to minister to a mind diseased,' his malady returned. Mrs. Unwin carefully tended him through the crisis of his delirium, and through his long and slow recovery. When convalescent, he betook himself to writing hymns along with Mr. Newton, and to domesticating hares, with the particulars and little incidents of which amusement the world is pleasantly familiar. Mrs. Unwin also suggested, as a subject suited to his genius, *The Progress of Error*. C. set to work in December 1780, and by the following March had completed *Truth*, *Table-Talk*, *The Progress of Error*, and *Expostulation*. Although the volume was completed in 1781, its publication was delayed till the following year.

In 1781, C. made the acquaintance of Lady Austen, who suggested to him *The Task*, urged him to translate *Homer*, and—what the world is perhaps still more grateful for—she related to him the history of John Gilpin. The story so seized C.'s fancy, that in the course of a single night he produced the poem which has tickled the midriffs of three generations. *The Task* was begun in the winter of 1783, and published in 1785. Its success was great, and C. began to be considered the greatest poet of his day. In 1784 he began the translation of Homer, which appeared in 1791. It was received with great applause. He had labored hard, and had now to pay the penalty. The pen was the only weapon with which he could keep his constitutional malady at bay; but now, when seated at his desk, his genius would not answer the call. He began to hear again the voices and the whisperings which had afflicted him in earlier days. Mrs. Unwin's faculties also became affected, and the two friends were groping in the same twilight, deepening for both in the darkness of death. They left Olney, and were received into the house of Mr. Johnson, in Tuddenham, in Norfolk. Here Mrs. Unwin died on the 17th December 1796. C. now fell into a state of utter dejection; in 1799, he was attacked by dropsy. He died on the 27th April 1800.

C. was a great innovator in English literature; he destroyed the sentimentalists led by Hayley, and the image-hunters headed by Darwin. His poetry is eminently healthy, natural, and unaffected. C. and Robert Burns we have to thank for bringing back nature to English poetry. Besides being a poet, C. was perhaps the most delightful letter-writer in the English language. Nothing can surpass the charm of his epistles—full of fun, gentle sarcasm, anecdote, acute remark, and a tender shadow of melancholy thrown over and toning down the whole. The best edition of C.'s works (accompanied by an admirable biography) is that of Southey, 15 vols. 12mo, Lond. 1837—1838.

COW'SLIP (*Primula veris;* see PRIMROSE), a common native of pastures in England and many other parts of Europe, although rare in Scotland, a delicate and modest little flower, a universal favorite, both for its beauty and its fragrance. The flowers are small, in an umbel at the top of the scape, the limb of the corolla short and concave. The flowers have sedative properties, and are sometimes used as an anodyne and anti-spasmodic. They are fermented with sugar to make *cowslip wine* an agreeable and favorite soporific domestic medicine.—The name VIRGINIAN COWSLIP is given to the *Dodecatheon Meadia*, a perennial plant, also of the natural order *Primulaceæ*, a native of North America, with a stalk about eight inches high, bearing an umbel of gracefully pendent lilac flowers, the petals reflexed over the calyx, the stamens and pistil long, and the anthers of a golden color. It is very ornamental in the flower-border, flowering in the end of April or beginning of May.

Cowslip.

COW-WHEAT (*Melampyrum*), a genus of plants of the natural order *Scrophulariaceæ*, having an oblong two-celled capsule, with a few seeds somewhat resembling grains of wheat. The species are natives of the temperate parts of the northern hemisphere, annual plants with opposite narrow leaves and yellow flowers, growing in woods, corn-fields, pastures, &c. Several are natives of England. They are said to be very fattening to cattle, and to give a yellow tinge and peculiar excellence to butter made from pastures in which they abound.

COW'RY (*Cypræa*), a genus of gasteropodous molluscs of the order *Pectinibranchiata*—the type of a family, *Cypræidæ*, to all of which the name C. is often extended—having the margin of the mantle prolonged into a siphon, by which water is conveyed into the gill chamber, and a spiral convoluted shell, the spire visible in the young, but entirely concealed in the adult, and the outer lip then thickened and bent in. The aperture extends the whole length of the shell. The shells, called *Porcelain Shells* by the French and Germans, are almost entirely calcareous in their composition, are richly enamelled, and often very beautiful. They are most abundant, and attain their largest size in the seas of warm climates. Only a few very small species are found on the British coasts. Some of the species are much prized by collectors of shells. The Money C. (*C. Moneta*) is of commercial interest, from its general use as a substitute for coin in many parts of Asia and Africa. It is not of great beauty, is yellow or white, often with a yellow ring, about an inch long, and nearly as broad as long. It is found on the Indian coasts, and in particular abundance on those of the Maldive Islands, and is one of their principal exports.

Money Cowry.

In Bengal, 3200 cowries are reckoned equal to a rupee, so that a C. is about equal in value to one thirty-sixth of a farthing. Yet cowries to the value of 200,000 rupees are said to have been at one time imported annually into Bengal. Many tons of cowries are annually imported into Britain, to be used in trade with the west of Africa, and this importation began when it was in the slave-trade that they were employed.—To the family *Cyprœidæ* belong the shells called *Poached Eggs* (*Ovulum*), the *Weaver's Shuttle Shell* (*Ovulum volva*), remarkable for its prolongation at both ends, &c. Fossils of this family are numerous in some strata, as in the *Bagshot Beds* (q. v.).

COX, DAVID, a landscape painter of the English school, was the son of a Birmingham smith, born 29th April 1783. He worked for a time as a smith, then at the toy-trade; next as an assistant to a scene-painter, from which he advanced to teaching and painting. He died at Harborne, 7th June 1859. An exhibition of his pictures, sketches, and water-color drawings was held in London in the same year. Before his fame was established, C. destroyed not a few of his drawings, or sold them for a few shillings; while before and after his death £1575 to £3430 have been paid for single pictures. He was thoroughly insular, and distinctly English in his habits and tastes. His paintings are usually small, and chiefly Welsh subjects; they show thorough familiarity with nature, and though sometimes rough in execution, are very effective; while he was remarkable for his success in sketching rain and wind, bursts of sunshine, or the herbage of marshes. In 1814, he issued a *Treatise on Landscape Painting in Water-Colors*, which is still an authority.

COXE, WILLIAM, a very industrious historical writer, was born in London, March 1747, and was educated at Cambridge. As tutor to the sons of several noblemen, he, at various times, spent many years on the continent, where he neglected no opportunity of collecting information about the countries which he visited. The result appeared in many volumes of travels and history, all of which are characterized by close observation, care, and research; but the writing in general is far from sprightly. Among the best known of C.'s works is his *History of the House of Austria*, which is still a standard work. C. also wrote *History of the Kings of Spain of the House of Bourbon*, *Memoirs of the Duke of Marlborough*, *Memoirs of Sir Robert Walpole*, and *Memoirs of the Pelham Administration*, besides many contributions to our knowledge of the topography and social condition of several continental countries. C., who commenced his clerical life in 1771 as a curate at Denham, near Uxbridge, ended it as Archdeacon of Wilts, which appointment he obtained in 1805. He died June 1828. Several of his works have been published in Bohn's *Standard Library*.

COXI'M, one of the head-waters of La Plata, rises in Matto Grosso, a frontier province of Brazil, towards Bolivia and Peru. After flowing first to the north-east, and then to the north-west, it enters the Taquari, itself a tributary of the Paraguay, in lat. 18° 24′ S. The C. receives many affluents.

COY'PU (*Myopotamus Coypu*), a rodent quadruped nearly allied to the beaver, with which it agrees in the number and character of its teeth, in its short limbs, in its feet having five toes each, the

Coypu (*Myopotamus Coypu*).

hinder feet webbed and the fore feet not webbed, and to a considerable extent in its habits; but from which it differs in the form of its skull, having a more elongated muzzle, and a contracted palate, and in its slender tail resembling that of a mouse. It is the only known species of its genus, and inhabits great part of South America, on both sides of the Andes, burrowing in the banks of the rivers, and sometimes in forests near the sea-beach. It is very nearly equal in size to the beaver, has small ears, very long and stiff whiskers, and long hair mixed with dense and soft short hair, the upper parts beautifully pencilled with different shades of yellow, the sides and under parts lighter and more uniform in color. The fur has become an important article of commerce, under the names of RACOONDA (q. v.) and NUTRIA, the latter name signifying in Spanish an otter, having apparently been given to it by mistake, but being that chiefly used in Britain.

CRAB, ROGER, a singular secretary of the English Revolution, served for seven years in the Parliamentary army. C. set up in business as a 'haberdasher of hats' at Chesham, in Buckinghamshire, and imbibed the idea that it was sinful to eat any kind of animal food, or to drink anything stronger than water. Determined to follow, literally, the injunctions given to the young man in the gospel, he sold off his stock-in-trade, distributing the proceeds among the poor, and took up his residence in a hut. His food consisted of bran, dock-leaves, mallows, and grass. The persecutions the poor man inflicted on himself caused him to be persecuted by others, cudgelled, and put in the stocks. He was four times arrested on suspicion of being a wizard, and was sent from prison to prison; yet still he would persist in his course of life. He published two pamphlets, one entitled *The English Hermit*; the other *Dagon's Downfall*. He died on the 11th of September 1680.

CRAB, the popular name of all the crustaceans of the order *Decapoda* (the highest order of crustaceans, characterized by great concentration of the nervous system and corresponding general concentration, by five pair of thoracic limbs, and by having the gills enclosed in a special cavity on each side of the thorax, covered by the carapace) and sub-order *Brachyoura* (characterized by the small size of the abdomen, which resembles a short tail curved under the thorax and appressed to it, all the most important viscera being included in the thorax), and extended also to some of the sub-order *Anomoura* (purse-crabs, hermit-crabs, &c., characterized by a condition of abdomen intermediate between that of the *Brachyoura* and that of the *Macroura*, or Long-tailed Decapod Crustaceans, such as the Lobster, Cray-fish, &c.). All the crabs, besides many other crustaceans, were comprehended in the Linnæan genus *Cancer*; but the number of species is very great, and the *Brachyoura* alone are now arranged into many genera and even families. The different kinds of crabs differ very much in the form of the carapace (the back), which in some is orbicular or nearly so; in some, much broader than it is long; in others, longer than broad; in some, prolonged in front into a kind of beak, &c.; also in its smoothness, or roughness with hairs, tubercles, or spines; in the length of the legs, &c. The eyes are compound, with hexagonal facets, and are elevated on stalks, which are generally short, but sometimes considerably lengthened, and which have the power of motion, so as to turn the eye in different directions.

Large edible Crab (*Cancer Pagurus*).

The first pair of limbs are not used for locomotion, but exhibit in great perfection the characteristic claws or pincers (*chelæ*) of the decapod crustaceans. Crabs are inhabitants of almost all seas; most of them, however, having their limbs formed for walking rather than for swimming, are found chiefly near the coast; some inhabiting comparatively deep water, and others abounding in those parts which are left by the receding tide, where they occur equally in the rock pools and among the moist sea-weeds. Some small kinds of crabs (*Pea Crabs*) are often found in the inside of mussels and other bivalve molluscs. Some crabs inhabit fresh water, particularly in the warmer parts of the world; and others, known as Land-crabs (q. v.), live among moist herbage, or burrow in sand or earth. Some have the last pair of limbs expanded at the extremity into a broad blade for swimming, and some have even all the four pair of limbs intended for locomotion thus expanded, and sometimes occur far out at sea. Some of the crabs, with very long legs, are known as Spider-crabs. Crabs moult or change their shell, not at fixed intervals or seasons, but according to the exigencies of their growth; the change being made with great frequency when they are very young, but rarely in advanced age: indeed, from the molluscs, and other animals sometimes found adhering to the carapace, it is inferred that the same covering is sometimes worn for a number of years.—The metamorphosis of crabs is noticed in the article CRUSTACEANS.—Crabs are interesting inmates of the aquarium, from their readiness in seizing food, their activity in tearing and eating it, their general habits, and, in particular, their pugnacity. The number of specimens is apt, however, to be soon diminished by the stronger killing and eating the weaker.—Many kinds of crabs are used as articles of food in different parts of the world, as the Large Edible C. (*Cancer Pagarus*) and Small Edible C. (*Carcinus Mœnas*) of the British shores. The latter is extremely common on all parts of the coast, but is not nearly so much esteemed as the former, which is much sought after, and is caught either in the holes of the rocks at low tide, or by means of a kind of trap,

basket which readily permits its entrance but not its escape, and which is baited with meat or animal garbage of some kind. In winter it seems to retire to deeper water. Its black claws and very broad carapace, arched at the sides, readily distinguish it from all other British species. It is sometimes nearly a foot in breadth. The claws of the Edible C. were formerly ground to powder and used as a medicine, having, however, no properties but those of carbonate of lime.

CRABBE, GEORGE, a late English popular poet, was born at Aldborough, in Suffolk, on the 24th of December 1754. His father was a warehouse keeper, and collector of the salt duties at Aldborough, and exerted himself to secure for his son a superior education. C. early exhibited a passion for all kinds of book-learning, with a decided bias towards poetry. After being tolerably grounded at school in mathematics and classics, he was, in his 14th year, apprenticed to a surgeon at Wickham Brook, near Bury St. Edmunds; but he had no liking for the profession, and ultimately proceeded to London, where he arrived in 1780, with £3 in his pocket, to make a trial of literature. For a while he was very unfortunate. At last, when threatened with arrest for debt, he resolved to make his case known to Burke. He told Mr. Lockhart years after, 'the night after I delivered the letter at the door, I was in such a state of agitation that I walked Westminster Bridge backwards and forwards until daylight.' The great orator at once appointed an interview, looked over C.'s poetical compositions, suggested several alterations which were adopted, and finally took *The Library* and *The Village* to Mr. Dodsley, by whom the first-named poem was published in 1781. C. went to reside at Beaconsfield with his generous and brilliant acquaintance, and while there met Fox, Sir Joshua Reynolds, and Lord Thurlow; the last of these invited the new celebrity to breakfast and presented him with a bank-note for £100 at parting.

By the advice of Burke, C. entered into holy orders, and was ordained curate of his native place in 1782. Shortly after, he was appointed domestic chaplain to the Duke of Rutland, and took up his residence at Belvoir Castle. *The Village* appeared in 1783, and established the reputation for its author. Shortly after Lord Thurlow presented him with two small livings in Dorsetshire; and now, finding himself above all fear of want, he married Miss Sarah Elmy, and entered into the enjoyment of the purest domestic happiness. In 1785, he left the castle, and took up his residence in the parsonage of Strathern; thereafter for many years he botanized, studied geology, wrote poems, saw—in hurried visits to London—the distinguished men of his time, and was courted by them, enjoying an uninterrupted course of happiness and honor.

The Newspaper appeared in 1785; in 1807, C. published *The Parish Register;* in 1810, *The Borough;* two years after, he produced his *Tales in Verse;* and in 1819, he gave to the world his *Tales of the Hall.* In 1813 his wife died, and shortly after he procured the living of Trowbridge, where for the remainder of his life he resided. In the autumn of 1822, he visited Edinburgh, and was the guest of Sir Walter Scott. His health began to fail in 1828; he died on the 3d of February 1832, aged 78.

C. disdained all the luxuries of his art. He has no heroes with a Hyperion front, and no heroines radiant as Aurora. He worked with the delf, not with the porcelain of human clay. He concerns himself with wild smugglers, denizens of villages by the sea, full of ancient and fish-like smells; gypsies on the heath cooking the fowl purloined from the neighboring barnyard, with tramps, vagabonds, and vagrants, and the inmates of the workhouse. On his page these unsavory individuals live, carouse, curse, brawl, and die. He has pages stern as anything in *The Inferno;* many, droll as Hogarth's pictures; and one or two so sweet, and tender, and pathetic, that no man possessed of any sensibility can read them unmoved.

CRABETH, DIRK and WOUTER, the last surnamed the Elder, were two brothers, glass-painters, born (it is supposed) at Gouda in South Holland, and who flourished in the latter half of the 16th century. It seems Dirk visited France in his youth, whilst Wouter journeyed to Italy, where he studied the works of Raphael, as is evident from his productions. Wouter, it is said, surpassed his brother in drawing, grace, and clearness, while Dirk surpassed him again in coloring. They, however, were jealous of each other, and each concealed from the other the secrets of his processes. Their conjoint work in the church of St. John at Gouda, is the masterpiece of the two brothers. Of the eleven painted windows in that church, seven are by Dirk and four by Wouter. They were done between 1555 and 1571. Dirk died, it is believed, in 1601. It is unknown when Wouter died. The brothers were buried in the sanctuary they had so surpassingly illustrated.

CRACKED HEELS. From careless grooming, washing horses' legs and imperfectly drying them, permitting them to stand in accumulations of filth or exposed to draughts, the skin becomes inflamed, tender, itchy, thickened, and by and by cracked. An ichorous noisome discharge exudes, and lameness often results. In animals with round *gummy* legs, it is sometimes constitutional; underbred horses with rough hairy fetlocks present the majority of cases; white heels, being more delicate, are especially affected; whilst the hind limbs, exposed as they are to filth and cold, suffer most frequently. Cleanse carefully with tepid water; wash with a diluted solution of Goulard's Extract, or any other mild astringent; or dress occasionally with oxide of zinc ointment. Give, besides, a half-dose of physic, and a few mashes, carrots, swedes, or such laxative food, and where persistent, use diuretics (q. v.). When dry and irritable, poultice and apply glycerine before proceeding with astringents. In cold weather, and especially when the horse is heated, interdict washing the legs, except with tepid water, and enjoin careful drying.

CRA'CKLIN, a kind of chinaware, the glazing of which is purposely cracked in the kiln, as an ornament.

CRACOVIENNE (*krakowiak*), the national dance of the Polish peasantry around Cracow. It has a rather melancholy than lively melody in $\frac{2}{4}$ time, and is accompanied by singing. The pair who lead off the dance often begin only with the music of their own voices, and are soon followed by others, and the charm of the dance consists much in the diverting movements by which they seem to chase and avoid each other. The Poles have a multitude of little ditties of two lines each, adapted to this music and dance, which generally contain some allusion to natural phenomena, accompanied with some slight pleasantry.

CRA'COW (Pol. *Krakov*), formerly the capital of a small Polish republic, and anciently the capital of the kingdom of Poland, is now an Austrian city, situated on the left bank of the Vistula, where it becomes a navigable river, in a beautiful plain, surrounded by an amphitheater of gentle hills. Lat. 50° 4′ N., long. 19° 52′ E. Pop. (1880) 66,095, of whom 14,000 are Jews. It contains 46 churches, 15 monasteries, 10 nunneries, and 7 Jewish synagogues. The ancient city of C. is a labyrinth of narrow, dark, and deserted streets, but contains many fine specimens of Gothic architecture in its churches and other edifices; and some handsome buildings are also to be seen in the more modern suburbs. The old walls have been converted into a promenade. In the midst of the houses rises the castle, a huge building of an imposing appearance. The cathedral contains the tombs of many of the Polish kings, and of some of the greatest men of the Polish nation. The university was founded in 1364, by Casimir the Great, whose design was carried into effect by Jagello and Hedwig in 1401. It was long the center of light for Poland, but decayed under the influences of the Jesuits, till it ceased to exist. It was reorganized and opened in 1817, and underwent important changes in 1833. It possesses a museum of natural history, a botanic garden, a library of more than 140,000 volumes, and many MSS. of great value in connection with Polish history. Its manufactures are trifling, and its trade, at one time extensive, became, for a period, very limited, but has of late years greatly revived, owing to the extension of its railway communications, which connect it with Vienna, Berlin, Warsaw, and Lemberg. Three miles west of the city is a vast tumulus to the memory of Kosciusko. It is composed of earth taken from all the patriotic battle-fields of Poland.

C. was founded by Krak, Prince of Poland, from whom it derives its name, about the year 700, became the capital of Poland in 1320, and continued to be so till 1609, when that honor was transferred to Warsaw by Sigismund III. It was taken by the Bohemians in 1039, by the Mongols in 1241, by the Swedes in 1655 and 1702, and by the Russians in 1768. On the third partition of Poland, in 1795, it was assigned to Austria. From 1809 to 1815 it formed part of the Duchy of Warsaw. The congress of Vienna established it as a republic, with a small territory containing about 140,000 inhabitants, under the protectorate of Russia, Prussia, and Austria. The territory bordered with that of each of these great powers. Internal dissensions between the nobles and the common people afforded a pretence for interference, and the sympathy shown by the inhabitants of C. for the cause of Polish independence in 1830 and following years was made the ground of proceedings, which terminated in 1846 in the annexation of C. to the Austrian dominions, a measure alleged to be necessary for the security of the neighboring states, but against which Britain and France protested. C. now forms part of the Austrian crown-land of Galicia. An extensive line of fortifications has been constructed around it by the Austrians, with numerous detached forts, and one immense fortress on a height commanding the city, whose outworks extend over a space of about five miles. These works are intended as a barrier against the advance of Russia.

CRAFT is a general designation for lighters, hoys, barges, &c., employed in loading or unloading large ships. In the royal navy, the name *small C.* is sometimes given to vessels commanded by lieutenants, such as cutters, schooners, gun-boats, &c. Also a term applied by seamen to any vessel whatever.

CRAG, a local term given specially to those masses of shelly sand which have been used from very ancient times in agriculture

to fertilize soils deficient in calcareous matter. Geologists have used it to characterize several groups of strata. See NORWICH or MAMMALIFEROUS CRAG, and RED CRAG.

CRAIG AND TAIL, a term used to designate a peculiar hill conformation, in which a bold and precipitous front exists on one aspect of a hill, while the opposite is formed of a sloping declivity. Those who first observed this form of the surface, believed it was the effect of currents of water moving in the direction indicated by the C. and T.; but latterly there have been speculations calling in the aid of ice, though not excluding the presence of water also. Fine examples of this structure occur in and around

Castle Rock, Edinburgh.

Edinburgh, where the western current has left the bold 'Craig' facing the west and the 'Tail' sloping towards the east; as, for example, the Castle rock, precipitous and unapproachable on every side except to the east, where it has protected the shale and sandstone beds from erosion. The direction and progress of the current can easily be traced; rushing against the hard basalt of the Castle rock, it was turned aside, and continued its course eastward, hollowing out the Nor' Loch on the one side and the Cowgate valley on the other, until the influence of the rock being lost, and aided by the resistance of the Calton Hill and Salisbury Craigs, the currents again met in the valley at Holyrood, when the 'tail' entirely disappears.

CRAIG, JOHN, an eminent preacher of the Reformation, was born in Scotland about 1512. Having spent some time as a tutor in England, he returned to Scotland, and entered the Dominican order, of which he had not long been a member when he fell under the suspicion of heresy, and was cast into prison. On his release, he traveled on the continent; and after some time was, through Cardinal Pole's influence, intrusted with the education of the novices in connection with the Dominican order at Bologna. While here, Calvin's *Institutes* fell in his way, and converted him to Protestant doctrines. Having openly avowed the change in his opinions, he was brought before the Inquisition, and sentenced to be burnt—a fate from which he was saved by the mob, on the death of Pope Paul IV., breaking open the prisons in Rome, and setting the prisoners at liberty. C. escaped to Vienna, and obtained some favor at the court of Maximilian II.; but the news of his being there reached Rome, and the Pope demanded his surrender as one condemned for heresy. The emperor, however, instead of complying with the request of his holiness, gave C. a safe-conduct out of Germany. He now returned to Scotland, and was appointed the colleague of John Knox in the parish church of Edinburgh. Thinking the marriage of Queen Mary and Bothwell contrary to the word of God, he, while holding this position, boldly refused to proclaim the banns. In 1572, C. was sent 'to illuminate the dark places' in Forfarshire and Aberdeenshire, and remained in the north until 1579, when he was appointed minister to King James VI. in Edinburgh. He now took a leading part in the affairs of the church, was the compiler of part of the Second Book of Discipline, and the writer of the National Covenant signed in 1580 by the king and his household. He was not slow to oppose the proceedings of the court when he deemed them opposed to Scripture. He died 12th December 1600. See the facsimile edition of C.'s *Short Summe of the whole Catechisme* of 1581, with Memoir by T. G. Law (1883).

CRAIG, THOMAS, author of the well-known *Treatise on the Feudal Law*, was born probably about 1538. What part of Scotland he was born in is not known. Educated first at St. Andrews, he afterwards prosecuted his studies at Paris, and passed as an advocate at the Scottish bar in February 1563, and in that or the following year was appointed justice-depute to Archibald Earl of Argyle, hereditary justice-general of Scotland.

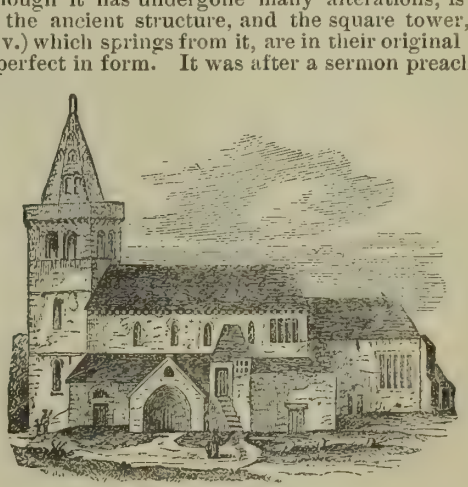
In literary pursuits, C. has distinguished himself above all his contemporaries, and while at the head of the criminal judicature of Scotland he did not neglect the *belles-lettres*, as was evidenced by an epithalamium on the queen's marriage with Darnley, and by a poem on the birth of James I. Besides his work on *Feudal Law*, C. wrote on the *Succession to the Throne of England*, in which he took a warm interest; a treatise on the union of Scotland and England, and one on *Homage*, vindicating Scotland from the charge of feudal dependence on England, which had been asserted by Hollinshed in his *Chronicles*, together with many poetical pieces. In the latter part of his life, C. acted as advocate for the Church of Scotland. He seems to have been high in favor with James VI., who wished to confer the honor of knighthood upon him; and when C. steadily refused, ordered that all persons should address him as if he really had accepted the honor. He died February 1608.

CRAIGLEI'TH STONE, a siliceous sandstone belonging to the carboniferous series, quarried at Craigleith, near Edinburgh, and largely used for building in that city, for which it is admirably adapted by its purity, durability, and the ease with which it can be wrought.

CRAIK, GEORGE LILLIE, was by birth a Scotchman. Born in Fifeshire in 1799, he was educated for the church at St. Andrews University, but, preferring a literary career, he went to London in 1824. His first work of importance was the *Pursuit of Knowledge under Difficulties* (1831), forming part of the series of publications issued by the Society for the Diffusion of Useful Knowledge. He also contributed largely to the *Penny Cyclopædia*. In 1839, C. became editor of the *Pictorial History of England*, some of the most valuable chapters of which were written by himself, and have since been enlarged and republished separately as independent works. Such are his *Sketches of the History of Literature and Learning in England from the Norman Conquest to the Present Time* (6 vols., 1844), and his *History of British Commerce from the Earliest Times* (3 vols., 1844); and in the same year, *Bacon, his Writings and Philosophy*. In 1849, C. was appointed to the chair of History and English Literature in Queen's College, Belfast, a situation which he occupied till he died in 1866. C. possessed an energetic mind, his thinking was clear, his style accurate, and he was conscientious in his statement of facts. Many of his slighter works contained suggestions in politics and social science which were both valuable and original, some of which were afterwards appropriated by, or ascribed to, others. In the first class we may mention the idea of mutual citizenship; and in the second, that of the representation of minorities, which unquestionably originated with him. Between 1849—1852 appeared his *Romance of the Peerage;* in 1855, his *Outlines of the History of the English Language;* in 1857, *The English of Shakspeare*.

CRAIK, MRS. Miss Dinah Maria Mulock, well known as the author of *John Halifax, Gentleman*, and other popular novels, was born at Stoke-upon-Trent in 1826, and married in 1865 a nephew of Prof. Craik. Mrs. Craik's more recent works include *Fair France*, *Hannah*, *Adventures of a Brownie*, and *The Life of John Martin*.

CRAIL, a royal and parliamentary burgh and seaport in the 'East Neuk' of Fifeshire, 2 miles south-west of Fifeness, and 10 miles south-east of St. Andrews. Pop. (1881) 1148. Along with St. Andrews, East and West Anstruther, Cupar, Kilrenny, and Pittenweem, it returns one member to parliament. C. was a town of some note in the middle ages, being then called Caryll. There are traces of an old castle and of a priory college. The Established Church, though it has undergone many alterations, is still substantially the ancient structure, and the square tower, with the broach (q. v.) which springs from it, are in their original condition, and very perfect in form. It was after a sermon preached in this



Crail Church (before the restoration).

church by Knox in 1559, that his hearers rushed in an infuriated mob to St. Andrews, and burnt the magnificent cathedral of the Episcopal metropolis. Archbishop Sharp was for some time minister of Crail. The harbor of C., though small, is safe; but there is a much more commodious site for a harbor in what is called Roome Bay, in the immediate neighborhood, the desirableness of converting which into a harbor of refuge has often been urged on government. Could this improvement be effected, it is believed that C. would again become, as it was formerly, the great rendezvous for the herring-fishery. Even without this advantage, there has been a great revival in this branch of trade of late years, and fish is now cured to the value of £20,000 to £30,000 annually in the little fishing towns in this neighborhood. Being in a retired

spot, with many traces of the well-being and good taste of earlier times still clinging to it, C. is eminently suited for a summer residence for sea-bathing purposes. Its bold coast offers pleasant rambles, and interesting excursions to the geologist and botanist. The town is lighted with gas, possesses good shops and markets, a reading-room, lecture institute, &c.

CRAKE (*Crex*), a genus of birds of the rail family (*Rallidæ*), differing from the true rails in having the bill shorter than the head and comparatively thick. The wings are also armed with a small concealed spine. The name is derived from the harsh call-note of the male. The best known species is the common CORN-CRAKE or LAND-RAIL (*C. pratensis*), the frequent call-note of which is heard from every field of corn or rye-grass in valleys and low grounds in the early part of summer, and is associated by almost every inhabitant of Britain with all that is pleasant in that pleasant season. The corn-crake is a very pretty bird, of a reddish-brown color, marked with dark-brown in streaks along the middle of the feathers, lighter below; it has rather long legs and long toes; the tail is rather short and pointed. It runs rather swiftly, so as to be able sometimes to escape from a dog; but flies

Corn-Crake (*Crex pratensis*).

rather heavily, although it is a bird of passage, and is seen in Britain only in summer. It visits, in like manner, all the northern parts of Europe, and extends its migrations even to Iceland, spending the winter on the shores of the Mediterranean and in Africa. Its call-note may be so exactly imitated by passing the edge of the thumb-nail briskly along the points of the teeth of a small comb, that it can thus be decoyed within a short distance, although it is a very shy bird, and multitudes are familiar with its cry who never saw it in their lives. Its weight is ordinarily about six ounces. It is very highly esteemed for the table; and, according to Drayton, 'seldom comes but upon rich men's spits.' Two or three other species, very rare in Britain, but more common in the southern parts of Europe, are chiefly found in marshy grounds, and sometimes receive the name SORA (*Zapornia*). With them is ranked the CAROLINA RAIL or SORA RAIL (*C. Carolinus*) of North America, which spends its winters in the States near the Gulf of Mexico, but migrates northwards in summer, and is sometimes seen in vast numbers about marshes and the reedy margins of lakes and rivers, particularly in its migration southward in autumn. Its size is about equal to that of the corn-crake; and its color is very similar, but with mingled short streaks of white. It is much esteemed for the table.

CRA'MBÉ, a genus of plants of the natural order *Crucifetæ*; having a pouch (*silicle*) of two unequal joints, of which the upper is globose and one-seeded, the lower abortive. The cotyledons (q. v.) are conduplicate. The species, which are not very numerous, are scattered over the world. One is a native of Britain, *C. maritima*, the well-known SEA-KALE (q. v.). Another, *C. Tartarica*, with much divided leaves and a great fleshy root, a native of Hungary and other central parts of Europe and of Asia, is sometimes called Tartar Bread; and its root is eaten in the countries of which it is a native, either boiled, or more generally peeled and sliced with oil, vinegar, and salt.

CRAMP, an irregular, involuntary, and painful contraction of a voluntary muscle, without insensibility or other disturbance of the general system. C. is often the effect of cold, and has proved fatal to swimmers by attacking them suddenly when in the water. Otherwise it is a disease of little importance, and readily removed by warmth and friction, with regulated movement of the muscles affected. Cramps are a distressing sympton in cholera (q. v.), in which disease it has been proposed to treat them by applying a tight bandage or tourniquet (q. v.) to the affected limbs. See SPASM.

CRAMP RINGS, were rings which were supposed to cure cramp and the 'falling-sickness.' They are said to have originated as far back as the middle of the 11th c., in a ring presented by a pilgrim to Edward the Confessor, which, after that ruler's death, was preserved as a relic in Westminster Abbey, and was applied for the cure of epilepsy and cramp. Hence appears to have arisen the belief that rings blessed by English sovereigns were efficacious in such cases; and the custom of blessing for distribution large numbers of C. R. on Good Friday continued to exist down to the time of Queen Mary. The accomplished Lord Berners, ambassador to Spain in Henry VIII.'s time, writes from Saragossa to Cardinal Wolsey: 'If your grace remember me with some crampo ryngs ye shall doo a thing muche looked for; and I trust to bestow thaym well with Goddes grace.' The metal the rings were composed of was what formed the king's offering to the cross on Good Friday, usually either gold or silver. The superstitious belief in the curative property of C. R. made out of certain pieces of silver obtained in particular ways, still lingers in some of the less enlightened English counties.

CRANACH, LUCAS, a celebrated German painter, was born in the bishopric of Bamberg in the year 1472. Little is known of his early life, except that he was instructed in art by his father—that he visited Palestine in 1493 with the Elector Frederick the Wise of Saxony, who made him his court painter in 1504, at which period we find him in high reputation, especially noted for his facility. In 1508, the elector made him a grant of armorial bearings, having for crest a winged serpent. He made a journey into the Netherlands in 1509, and there drew a picture of Charles V.—the future emperor—then nine years old. C. seems to have acted as *factotum* at the court of the elector and his two successors, preparing for and directing the ceremonies and festivities, and knew besides how to follow other lucrative trades. In 1520 he bought an apothecary's business at Wittenberg, where he was also a bookseller and paper-maker, became councillor and chamberlain, and was twice chosen burgomaster of the town.

C. was closely bound up with the early reformers. He was the intimate friend of Luther, whose picture he several times painted. In 1550 he went to Augsburg to share the imprisonment of the elector, and returned with him to Saxony in 1552. C. died at Weimar, on the 16th October, 1553, in the 81st year of his age, and was buried in the court church there. He had two sons, one of whom, Lucas, was known by the name of 'the younger Cranach,' an excellent colorist and portrait-painter.

C. has left behind him an unusually large number of authentic pictures—indeed, he painted beyond his powers. He excelled in portraits, in painting animals, in fabulous and droll pieces, and was an excellent colorist; but failed in form, grace, and unity, and in the higher walks of art. His last and greatest work is an altar-piece in the church of Weimar—a mystical representation of the crucifixion. His peculiar humor is best seen in such pictures as his 'Samson and Delilah' and his sylvan scene containing 'Apollo and Diana.'

CRA'NBERRY (*Oxycoccus*), a genus of small evergreen shrubs of the natural order *Vaccineæ*, distinguished from the genus Vaccinium (see WHORTLEBERRY) by the wheel-shaped corolla, with segments rolled back and the filaments leaning to the pistil. The species are few, natives of the colder regions of the northern hemisphere. The fruit is acid, and is in great request for making tarts.

The only British species is the Common C. (*O. palustris*, formerly *Vaccinium Oxycoccos*), a native also of the northern parts of Europe, Asia, and America. It grows in peaty bogs and marshy grounds, and is a small wiry shrub with creeping thread-like branches, and small oval leaves rolled back at the edges. The blossoms are small but beautiful, of a deep flesh color. Large quantities of the fruit are collected in some places in the north of England, and in other countries, although the draining of bogs has now made it scarce where it was once plentiful. In Germany it is collected by means of a wooden comb, and preserved with sugar. In England, cranberries are often preserved in bottles closely corked or filled with pure water, in which they may be kept for a long time. They are an excellent addition to sea stores. Wine is made from them in Siberia, and a beverage made from them is sold in the streets of St. Petersburg.—The AMERICAN C. (*O. macrocarpa*) is a much larger and more upright plant, with leaves much larger and less rolled back at the margin. The berries are also larger and of a brighter red. It is a native of North America, frequent in Canada, and as far south as Virginia, growing in bogs, and particularly in elevated situations and where the soil is sandy. The berries are collected by means of a rake. Large quantities of them are exported to Europe. Cranberries are imported into Britain from Russia and other parts of the continent. Both kinds may be cultivated in gardens, in a peat-soil kept very moist or round the margin of a pond, and the produce of a small space properly managed is so great, that it is surprising that a C. plot should not be much more frequent.—The berries of the Red Whortleberry (*Vaccinium vitis idaea*) are sold under the name of cranberries in Aberdeen and other places, and are used in the same way.—A third species of C. (*O. erecta*, formerly *Vaccinium erythrocarpon*), a native of lofty mountains in Virginia and Carolina, is a shrub two feet high, and with a habit more like that of the whortleberries than of the other cranberries; it has a fruit remarkable for transparency and of exquisite flavor, and ap-

pears to deserve an attention and cultivation which it has not yet received.—The TASMANIAN C. is the fruit of *Astroloma humifusum*, a little shrub with trailing stems, leaves somewhat resembling those of juniper, and beautiful scarlet blossoms, which is found in all parts of Van Dieman's Land. It belongs to the natural order *Epacridaceæ*. The fruit is of a green or whitish color, sometimes slightly red, about the size of a black currant, and con-

Cranberry (*Oxycoccus palustris*):
a, part of stem and branches, with roots, leaves, and flowers;
b, a berry; *c*, transverse section of a berry.

sists of a viscid apple-flavored pulp, enclosing a large seed.—*Styphelia adscendens*, a small prostrate Australian shrub of the same natural order, has a fruit very similar to this; and in New South Wales the name C. is likewise given to the red acid berries of *Lissanthe sapida*, a low evergreen shrub, with small white flowers, also belonging to *Epacridaceæ*.

CRA'NBROOK, a small town in the south of Kent, 30 miles south-west of Canterbury. It lies near the Crane, on an outlying ridge of the Hastings sand formation, and is the chief village of the Weald. Pop. of parish (1871) 4331. It has a large hop business. It was once the center of the clothing manufacture, introduced by the Flemings in the time of Edward III.; but this branch of industry has long since disappeared.

CRANE, a machine employed for the purpose of lifting weights. Cranes are of various kinds, but the most common consist of an upright revolving shaft, with a projecting arm or jib, having a fixed pulley at the extremity, over which is passed one end of the rope or chain to receive the weight, the other end being attached to a cylinder with wheel and pinion, by means of which the weight is raised to the required height. By the revolving motion of the upright portion, the load can be deposited on any spot within the sweep of the jib.

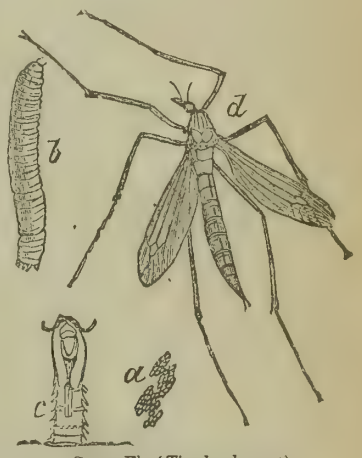
CRANE (*Grus*), a genus of birds of the order *Grallatores*, the type of the family *Gruidæ*. This family differs from herons, bitterns, storks, &c., in having the hind toe placed higher on the leg than the front ones. It consists also of birds less addicted to marshy places, and which feed not only on animal, but, to a considerable extent, on vegetable food. They are all large birds,

Crane (*Crus cinerea*).

long legged, long necked, and of powerful wing, although their wings are rounded and not elongated; some of them performing great migrations, and flying at a prodigious height in the air. One of these is the COMMON C. (*G. cinerea*), which breeds in the northern parts of Europe and Asia, retiring in winter to tropical or subtropical regions. Flocks of cranes periodically pass over the southern and central countries of Europe, uttering their loud harsh cries in the air, and occasionally alighting to seek food in fields or marshes. The C., when standing, is about four feet in height; the prevailing color is ash-gray, the face and throat nearly black, the wing primaries black.

The tertial feathers of the wings are elongated, reaching beyond the ends of the primaries, and their webs are unconnected; they are varied and tipped with bluish-black, and are the well-known plumes once much used in ornamental head-dresses. The visits of the C. to Britain are now very rare, although in former times they were comparatively frequent. It feeds on roots, seeds, &c., as well as on worms, insects, reptiles, and even some of the smallest quadrupeds. It is much esteemed for the table.—There are several other species of Crane. The WHOOPING C. (*G. Americana*) is considerably larger than the common C., which it otherwise much resembles except in color; its plumage, in its adult state, is pure white, the tips of the wings black. It spends the winter in the southern parts of North America. In summer it migrates far northwards, but rather in the interior than the eastern parts of the continent.—To the C. family belong also the Demoiselles (q. v.), with which, rather than with the true cranes, the Balearic Cranes or Balearicans are ranked.—Cranes use their bill as a dagger, and when wounded are dangerous to the eyes of a rash assailant.

CRANE-FLY (*Tipula*) a genus of dipterous (two-winged) insects of the family *Tipulidæ*, to the whole of which the name C. is often extended, nearly allied to the Gnat family (*Culicidæ*), which they resemble in their beautifully feathered and tufted antennæ, but from which they differ in having a comparatively short proboscis. The true crane-flies are also of comparatively large size. They have lanceolate spreading wings, and very long legs. One species (*T. oleracea*) is the well-known *Daddy* (or *Harry*, or *Peter*) *Long-legs*. This and other species abound in arable lands, gardens, meadows, &c., in summer; and their larvæ—remarkably tough worms without legs, sometimes confounded with wire-worms by farmers—are extremely destructive to crops of various kinds, devouring the roots of corn and pasture grasses, potatoes, turnips, and almost all the plants ordinarily cultivated either in field or garden. Rolling of fields is used in killing them; and soot, salt, and other applications are employed in gardens.



Crane-Fly (*Tipula oleracea*):
a, eggs; *b*, larva; *c*, pupa case as left by the insect, sticking out of the earth; *d*, perfect insect.

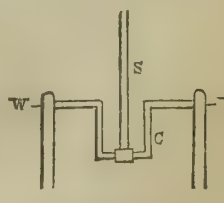
CRANE'S-BILL. See GERANIUM.

CRANGANO'RE, a maritime town of the district of Malabar on the west coast of Hindustan, stands at the mouth of a river of its own name, otherwise called the Aycotta. It is 19 miles to the north of Cochin, and 75 to the south of Calicut, being in lat. 10° 14′ N., and long. 76° 16′ E. At one time possessed by the Portuguese, it was taken from them by the Dutch about 1663; and after being purchased by the rajah of Travancore in 1789, and wrested from him by Tippoo Sultan in 1790, it was conceded by the latter to the British. But the more ancient history of the place is still more interesting, for here have existed from the 4th and 5th centuries respectively congregations of Jews and Christians.

CRA'NGON. See SHRIMP.

CRA'NIUM. See SKULL.

CRANK, in Machinery is an arm or a bend on an axle or shaft, which may be driven by a connecting-rod or by the hand, its use being to convert an alternating straight motion into a continuous revolution. A crank may have part of the shaft on both sides, so that one rod, S, may drive two wheels, W, W, as in the fig. There are two positions in a C. in which the connecting-rod exercises no power whatever—viz., when the arm of the crank, C, is parallel to the connecting-rod, as in the fig., and again when the crank is at the opposite point of its course. A push or pull of the rod in such circumstances can only press the shaft against its bearings. The effect is greatest when the rod and the crank-arm are at right angles, and it decreases gradually on both sides of that position, until at top and bottom it is reduced to nothing. In order to carry the C. over these *dead points*, as they are called, a fly-wheel is fixed on the shaft; this receives



part of the force of the rod while at its best, acts as a reservoir, and by its stored-up momentum carries the shaft round when the rod is powerless.

CRA'NMER, THOMAS, one of the chief reformers of the English Church, and the first Protestant Archbishop of Canterbury, was born at Aslacton, in the county of Nottingham, on the 2d of July 1489. He was descended from an old Norman family, which is said to have come into England with William the Conqueror. In his 14th year, he went to Jesus College, Cambridge, of which he was elected a fellow in 1510. He devoted himself diligently to the study of the learned languages, and also to the study of Scripture. His mind seems to have been early interested in the writings of Erasmus, Luther, and Le Fevre, and especially in their interpretations of Scripture. In his 23d year, he married, and so lost his fellowship; but his wife dying about a year after marriage, he was restored to it by his college. In 1523, he took his degree of D. D., and was appointed lecturer on theology.

In 1528, during the prevalence of the sweating sickness in Cambridge, he retired with two pupils to Waltham Abbey; and Henry VIII. in company with Gardiner and Fox, afterwards Bishops of Winchester and Hereford, happening to be in the neighborhood, the event proved a turning-point in the life of Cranmer. The king was then seriously concerned about his divorce from Catharine of Aragon, and in conversation on the subject with Gardiner and Fox, Cranmer suggested that the question should be 'tried according to the word of God.' Fox having mentioned this suggestion to the king, Henry was greatly pleased, and 'swore by the mother of God, that man hath the right sow by the ear.' From this time, Henry never lost sight of Cranmer. He was asked to reduce his suggestion to writing, and to have it submitted to the European universities. After this he was appointed Archdeacon of Taunton, and one of the royal chaplains. He was also sent to Rome on a special embassy about the divorce, but met with little success. Subsequently, he was despatched to the Emperor on the same errand, and while in Germany, he married a second time, a niece of the German divine, Osiander. This took place in 1532; and shortly afterwards, on the death of Archbishop Warham, he was recalled to fill the vacant see. Under his auspices, Henry's divorce was speedily carried through, and C. married the king to Anne Boleyn, on the 28th May, 1533. In Anne's subsequent disgrace, and again, in the affair of Anne of Cleves, the archbishop took a part not very creditable to him. His position was no doubt a difficult one; but his character was naturally pliable and timid, rather than resolved and consistent. The same spirit characterizes the measures of religious reform which were promoted by him. On the one hand, he joined actively with Henry in restricting the power of the pope, and in suppressing the monasteries; but, on the other hand, he was no less active in persecuting men like Frith, Forrest, and others, who, on matters of religious faith, were disposed to advance further than himself or the king. He did what he could, however, to resist the reactionary movement which took place in 1539, and which is known by the institution of the 'Six Articles.' He was also instrumental in promoting the translation and circulation of the Scriptures. On Henry VIII.'s death, Cranmer was appointed one of the regents of the kingdom, and along with Latimer and others, largely contributed to the advance of the Protestant cause during the reign of Edward. He assisted in the compilation of the Service-book and the Articles of Religion. The latter are said to have been chiefly composed by him. He was also the author of four of the Homilies.

On the accession of Mary, he was committed to the Tower, along with Latimer and Ridley. In March 1554, they were removed to Oxford, and confined there in the common prison, called the Bocardo. Latimer and Ridley bore their cruel fate with magnanimous courage; but the spirit and principles of C. temporarily gave way under the severity of his sufferings. He was induced, in the hope of saving his life, to sign no fewer than six recantations; but his enemies were determined to be satisfied by nothing short of his death. On the 21st March 1556, he suffered martyrdom, as his fellow-reformers had done, opposite Baliol College. His courage returned at the end, and he died protesting his repentance for his unworthy weakness in changing his faith, and showing an unexpected fortitude in the midst of the flames.

CRANNOGES, the name given in Ireland and in Scotland to the fortified islands in lakes which were in common use as dwelling-places and places of refuge among the Celtic inhabitants. The etymology of the word is uncertain, but it is believed to refer to the timber which was employed either in the fortification of the island, or in the construction of the houses which were placed upon it.

The earliest notice of such lake-dwellings which has been observed, is in the pages of Herodotus (book v. chap. 16). Writing of the Persian invasion of Thrace and Macedonia under Darius—about 500 years before the Christian era, and less than 100 years before his own death—he relates how the satrap Magebazus, warring against the Pæonians, led certain tribes of them captive into Asia, but failed to conquer those who inhabited Lake Prasias. 'He sought, indeed,' says the historian, 'to subdue the dwellers upon the lake, but could not effect his purpose. Their manner of living is the following. Platforms, supported upon tall piles, stand in the middle of the lake, which are approached from the land by a single narrow bridge. At the first, the piles which bear up the platforms were fixed in their places by the whole body of the citizens; but since that time the custom which has prevailed about fixing them is this: They are brought from a hill called Orbelus, and every man drives in three for each wife that he marries. Now, the men have all many wives apiece, and this is the way in which they live. Each has his own hut, wherein he dwells, upon one of the platforms, and each has also a trap-door giving access to the lake beneath; and their wont is to tie their baby-children by the foot with a string, to save them from rolling into the water.

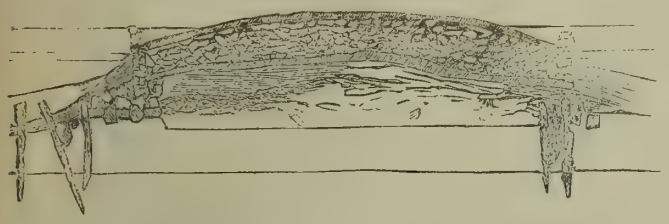
'They feed their horses and their other beasts upon fish, which abound in the lake to such a degree, that a man has only to open his trap-door, and to let down a basket by a rope into the water, and then to wait a very short time, when he draws it up quite full of them. The fish are of two kinds, which they call the paprax and the tilon.' The Lake Prasias of the Father of History seems to be the modern Lake Takinos, on the Strymon or Kara-su, a river which, rising on the borders of Bulgaria, flows southward through Roumelia, and, after expanding its waters into a lake, falls into the Gulf of Contessa. The fish named by Herodotus have not been identified by naturalists; Lake Takinos abounds in carp, tench, and eels.

The island-dwellings of Lake Prasias met with comparatively little attention until archæologists, quite recently, found the remains of similar habitations in other parts of Europe. The first discovery was made in Ireland in 1839, by Mr. W. R. Wilde, one of the secretaries of the Royal Irish Academy. The small lake of Lagore, near Dunshaughlin, in the county of Meath, having been drained, a circular mound, which had been an island in its waters, was observed to be thickly strewed with bones. As these were to be carted away for manure, it was found to be an artificial structure. Its circumference, measuring 520 feet, was formed by upright piles of oak about 7 feet long, mortised into oak-planks laid flat upon the marl and sand at the bottom of the lake. The upright piles were tied together by cross-beams, and the space which they enclosed was divided into compartments by oak-beams, some of which had grooves, so as to allow panels to be driven down between them. The compartments thus formed were filled with bones and black peaty earth. Portions of a second tier of upright piles were observed rising from the first tier. The bones were ascertained to be those of several varieties of oxen, of swine, deer, goats, sheep, dogs, foxes, horses, and asses. Along with them were found a vast number of weapons, ornaments, and utensils, fashioned of stone, bone, wood, bronze, and iron; such as swords, knives, spears, javelins, daggers, whetstones, querns (or hand-mills), beads, pins, brooches, combs, horse-trappings, shears, chains, axes, pots, and bowls. On reference to the ancient annals, in which Ireland is so rich, it was seen that, in 848 A.D., a hostile Irish chief 'plundered the island of Loch Gabhor [as Lagore was then written], and afterwards burned it, so that it was level with the ground;' and that again, in 933 A.D., 'the island of Loch Gabhor was pulled down' by the piratical Norsemen.

Mr. Wilde's discovery at Lagore was followed by other discoveries of the same kind elsewhere in Ireland, so that in 1857 the existence of about fifty C. had been ascertained; and every succeeding year has seen an increase of the number. They show several varieties of construction. The island at Lagore is a type of the purely artificial crannoge. But most frequently the crannoge was partly natural. An islet just level with the water, was raised artificially a foot or two above it. An islet too small to be a convenient habitation, or too easy of landing to be a place of defence, had its area artificially enlarged, or its banks artificially strengthened, generally by piles or stockades, but occasionally by heaps of stones. The space thus enclosed is generally a circle of from 60 to 80 feet in diameter; but in some cases the enclosed space is larger, and of an oval shape. The piles are generally of oak, mostly young trees, from four to nine inches broad, still bearing marks of the hatchet; usually a single row has been considered enough, but there are instances of two, and even of three rows. It would seem that originally the piles had risen several feet above the water, and it has been supposed that they were interlaced with branches placed horizontally, so as to form a screen or breastwork. The area within the stockade is sometimes wholly or partially covered with a layer of round logs, from four to six feet long, having stones, clay, or gravel above them. Fragments of oak-framing, with mortises and cheeks cut in them, have been found within the piles. In almost every instance, a few flat stones, apparently serving as a hearth, have been observed near the middle of the enclosure: in several C., two or three hearths have been met with. In some cases, a causeway leads from the

island to the mainland; but in general the crannoge was to be reached only by boat, and scarcely any crannoge has been discovered without the remains of a primitive canoe, hollowed out of the trunk of an oak, being found beside it. In at least one crannoge, a pier or jetty projected from the island; it was a double row of piles and stretchers, running parallel to each other at a distance of about eight feet, and supporting a platform of logs. On almost every crannoge one or two querns (q. v.) have been found, along with bones of oxen, deer, goats, and swine, horns of cattle, deer, sheep, and goats, boars' tusks, and sharpening stones: fragments of pottery, and articles of stone, bone, horn, wood, glass, copper, bronze, brass, and iron, are of somewhat rarer occurrence. Many of the C. had been submerged by the gradual rise of the lakes in which they stood, so that their existence only became known as the great drainage-works of late years reduced the waters to their old level.

The accompanying woodcut shows a section (on the scale of 1 inch to 20 feet) of the crannoge in Ardakillin Lough, near Stokes-



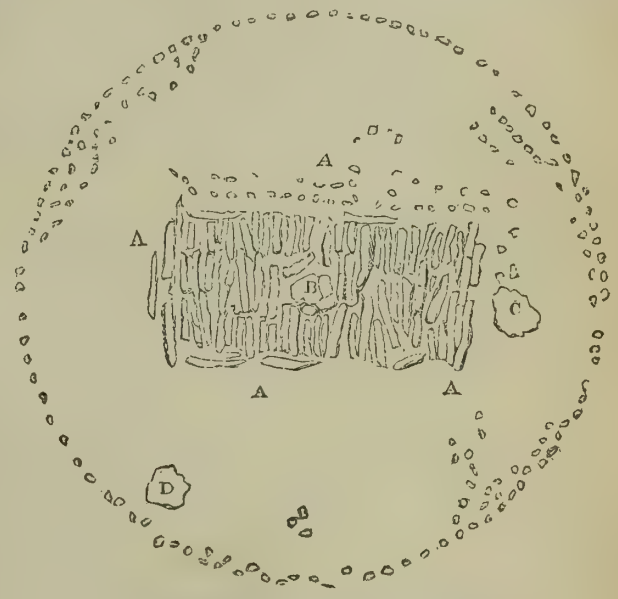
town, in the county of Roscommon. The uppermost line marks the highest level of the waters of the lake; the middle line, the common winter level; the third line, the common summer level. The upper surface of the crannoge was formed of a layer of loose stones, surrounded by a wall, partly supported by piles. The stones rested on the natural clay, peat, and boulders of the island, in digging through which strata of ashes, bones, and logs of timber were met with. The stockades were of oak; the oblique or slanting stockade shown in the woodcut represents a girdle of sheet-piling which quite encircled the crannoge.

The woodcut in the next column gives a ground-plan (on the scale of 1 inch to 20 feet) of one of two C. in Drumaleague Lough, in the county of Leitrim. The circle within the ring of stockades is 60 feet in diameter; in some places there are two, and in others, three rows of stockades; and within this outer ring, there are groups of piles, some of them arranged apparently for some special purpose. The oblong space in the middle, marked A, is covered by a rude platform of round logs, chiefly of alder, from four to six feet in length; it was probably the floor of the log-house, which was the chief or only dwelling-place on the islet. B shows where the hearth stood—a collection of stones, still retaining traces of fire; C marks a heap of stiff clay; D, the root of a large tree nearly buried in the peat, the surface of the wood being beveled off with a hatchet, so as to form a sort of table, under which was found a heap of bones, apparently of deer and swine.

The Irish annals, it has been seen, make mention of C. as early as the 9th c., and they figure in history down to the middle of the 17th century. The crannoge of Lough Lynch, in Antrim, is shown as the birthplace of Colkitto, a chief who figured in Montrose's wars, and has found a place in one of Milton's sonnets. The crannoge of Roughan Lake, near Dungannon, was the last retreat of Sir Phelim O'Neil in 1641. Two years later, there is record of an attempt to flood the crannoge of Loughinsholin, in the county of Londonderry, by turning a stream into the lake, and damming up its outlet. This attempt failed; but in 1645 the garrison were compelled by hunger to give the crannoge to the flames, and make their escape. In 1567, an agent of the English government, who was asked what were the castles of the O'Neil, wrote in reply: 'For castles, he trusteth no point thereunto for his safety, as appeareth by the razing of the strongest castles of all his countries; and that fortification that he only dependeth upon is in certain fresh-water lochs in his country, which from the sea there comes neither ship nor boat to approach them: it is thought that there, in the said fortified islands, lieth all his plate (which is much), and money, prisoners, and gages [i. e., hostages]; which islands have in wars heretofore been attempted, and now of late again by the lord-deputy there, Sir Harry Sydney, which for want of means for safe conduct upon the water hath not prevailed.'

While archæologists were still exploring the C. of Ireland, structures of a similar kind were discovered in the heart of the European continent. The winter of 1853—1854 was one of the driest that had been seen in Switzerland, and the lakes sank to a lower level than was ever known before. The inhabitants of the village of Meilen, on the Lake of Zurich, took advantage of this unusual subsidence to reclaim a piece of land from the lake. As the work went on, a learned antiquary, Dr. Ferdinand Keller, discovered the remains of rows of deeply driven piles, and, imbedded in the mud around them, found heaps of primitive weapons, tools, and utensils, made of stone and bone. Closer examination satisfied him that the piles had supported a platform; that on this platform huts had been raised; and that after being thus occupied, probably for centuries, the structure had been destroyed by fire. The discovery in the Lake of Zurich of these *Keltische pfahlbauten* (Celtic pile-buildings), as Dr. Keller called them—*habitations lacustres* (lake-dwellings), as other Swiss archæologists have termed them—was followed almost immediately by the discovery of erections of the same kind in other lakes of Switzerland. No fewer than from 30 to 40 have been found in the upper and lower lakes of Constance; as many as 30 in the Lake of Geneva; more than 20 in the Lake of Neuchâtel; 10 in the Lake of Bienne; besides others in the deep peat-bogs which surround the hill of Chamblon, in the Vallée de l'Orbe, and in the lakes of Morat, Inkwyl near Soleure, Moosseedorf near Bern, Pfaffikon near Zurich, Wauwyl near Lucerne, and Nussbaumen in the canton of Thurgau. The site chosen for these lake-dwellings was generally a sunny and sheltered bay, with a gently shelving bottom of mud or clay. The piles, from four to ten inches in diameter, were rudely fashioned of whatever wood was at hand, oak, fir, ash, beech, birch, cherry, or apple. They were driven in a depth of not less than six or seven feet of water, at a distance of from 100 to 300 feet from the shore.

They were ranged generally from one to two feet apart, in the form of a narrow parallelogram, having its longest side in a line with the edge of the lake. At Wangen, on the lower lake of



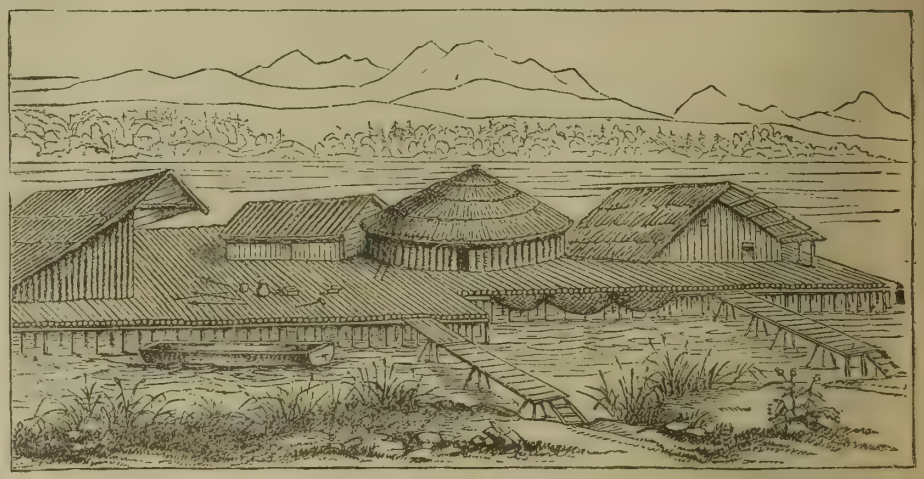
Ground-plan of Crannoge in Drumaleague Lough.

Constance, the piles, from 30,000 to 40,000 in number, extend about 700 paces in length, and about 120 in breadth. At Morges, on the Lake of Geneva, the piles stretch 1200 feet in length, by 120 feet in width, so that they would have supported a platform with an area of about 18,000 feet, sufficiently capacious, according to the calculations of M. Frederic Troyon of Lausanne, to contain 316 huts, with a population of 1264 persons. The huts, it would seem, were for the most part circular in shape, measuring from 10 to 15 feet in diameter; they were of wattles, plastered with clay, masses of which hardened by fire, still bearing the marks of the wattles which it had received when wet and soft, have been recovered from the beds of the lakes. In at least one instance, the remains of a bridge or gangway, leading from the platform to the shore, have been discovered. Many small boats, hollowed out of the trunks of trees, have been found; and one large vessel of the same kind, 50 feet long, and 3½ feet wide, has been observed at the bottom of the Lake of Bienne. The woodcut in the preceding column shows the *pfahlbauten*, as the Swiss archæologists believe them to have been in their original state.

The lake-dwellings of Switzerland have obviously much more resemblance to those of Lake Prasias, described by Herodotus, than to the C. of Ireland. But the Swiss at the same time can show examples of the Irish type. At Nidau Steinberg, in the Lake of Bienne, there is an artificial mound of stones, resting on horizontal planks, and encircled by a row of upright piles. It is now submerged, but when—as the Swiss believe—the lake stood at a lower level, it must have been an island. At Moringen, in the same lake, there is another pile-building, enclosing a mound of stones which has an area of about half an acre. A canoe which had been used in its construction lies with its load of stones at

the bottom of the lake. Structures still more nearly resembling the Irish C. have been found in the lakes of Inkwyl, Nussbaumen, and Wauwyl.

History and tradition are alike silent as to the pile-buildings of the Swiss lakes. That they belong to a remote age, will readily be granted, even by those who may hesitate to accept 'the stone, bronze, and iron periods' on which the Swiss antiquary rests their claims to 'pre-historic' antiquity; or who may question the grounds on which the Swiss naturalist assigns them to the 15th c. before the Christian era. Of the remains found in them, many appear to be those of a rude people—such as spear-points, arrow-heads, axes, chisels, knives, and even small saws, of flint and stone; arrow-heads, daggers, hammers, bodkins, needles, pins, rings, bracelets, necklaces, of bone or horn. Articles of bronze, some of them richly ornamented, are at the same time of common occurrence; and swords and other objects of iron are met with in considerable numbers. Some of the Swiss archæologists seem at one time to have thought that the piles surrounded by stone and bone implements showed marks of greater age than the piles surrounded by bronze implements. It is now admitted, however, that both stone and bronze objects, and bronze and iron objects, are to be found in the same group of piles. It is to be remarked, too, that many of the objects of stone, bone, horn, bronze, and iron, are fashioned of the same shape and for the same use, differing only in the substance of which they are made. Whoever the dwellers on the *pfahlbauten* were, their remains show that they grew wheat and barley; that they ate the flesh of the ox, the goat, the sheep, and the pig; that among the beasts of the chase which they hunted down was the now extinct species of the aurochs (see BISON); that they had horses, dogs, and cats; that they had apples, pears, wild-plums, and wood-raspberries; that they baked pottery; that their women plied the distaff and knitted; that they made hempen mats; and that they wove linen cloths.



Crannoge restored.

Hitherto, archæologists knew of lake-dwellings as existing only in Ireland and Switzerland; but in 1857, Mr. Joseph Robertson read a paper to the Society of Scottish Antiquaries, proving that they were to be found in almost every province of Scotland. He not only ascertained the existence of about 50 examples, but was able to show from records that they were known in Scotland by the same name of C. which they received in Ireland. The resemblance between the Scottish and Irish types seems, indeed, to be complete. Every variety of structure observed in the one country is to be found in the other, from the purely artificial island, framed of oak-beams, mortised together, to the natural island, artificially fortified or enlarged by girdles of oak-piles or ramparts of loose stones; from the island with a pier projecting from its side, to the island communicating with the mainland by a causeway. If there be any difference between the C. of the two countries, it is that the number of C. constructed altogether of stones is greater in Scotland than in Ireland—a difference which is readily explained by the difference in the physical circumstances of the two countries.

Among the more remarkable of the Scotch C. is that in the loch of Forfar, which bears the name of St. Margaret, the queen of King Malcolm Canmore, who died in 1097. It is chiefly natural, but has been strengthened by piles and stones, and the care taken to preserve this artificial barrier is attested by a record of the year 1508. Another crannoge—that of Lochindorb, in Moray—was visited by King Edward I. of England in 1303, about which time it was fortified by a castle of such mark that in 1336, King Edward III. of England led an army to its relief through the mountain-passes of Athol and Badenoch. A third crannoge—that of Loch Cannor or Kinord, in Aberdeenshire—appears in history in 1335, had King James IV. for its guest in 1506, and continued to be a place of strength until 1648, when the estates of parliament ordered its fortifications to be destroyed. It has an area of about an acre, and owes little or nothing to art beyond a rampart of stones and a row of piles. In the same lake there is another and much smaller crannoge, which is wholly artificial. Forty years after the dismantling of the crannoge of Loch Cannor, the crannoge of Lochan Eilean, in Strathspey, is spoken of as 'useful to the country in time of troubles or wars, for the people put in their goods and children here, and it is easily defended.' Canoes hollowed out of the trunks of oaks have been found as well beside the Scotch, as beside the Irish crannoges. Bronze vessels, apparently for kitchen purposes, are also of frequent occurrence. Deer's horns, boars' tusks, and the bones of domestic animals, have been discovered. Our knowledge of Scottish C. (of which in 1880 about 35 were known) was extended by the examination of one near Tarbolton, Ayrshire, by Mr. Cochran-Patrick and Dr. Munro.

Since 1857, the existence of lake-dwellings has been discovered in Savoy, in Upper Italy, in Hanover, in Prussia, and in Denmark. Less certain traces have been found in England, in draining a mere at Wretham Hall, near Thetford, in Norfolk. The savages of Borneo and New Guinea still live on the water, in huts perched upon platforms supported by piles; and wooden houses raised upon piles are common in Burmah and Siam, on the creeks and rivers of the Strait of Malacca, and it is believed elsewhere in Asia. A bas-relief from the palace of Sennacherib, engraved in Mr. Layard's *Monuments of Nineveh*, represents what seem to be artificial islands, formed, it would seem, by wattling together the tall reeds of the marshes on the lower part of the Euphrates.

The C. of Ireland are described in the *Proceedings of the Royal Irish Academy*, vols. i., v., vii.; Mr. Wilde's *Catalogue of the Museum of the Royal Irish Academy*; *The Archæological Journal*, vols. iii., vi.; Mr. Digby Wyatt's *Observations on the Early Habitations of the Irish* (Lond. 1858); *The Ulster Journal of Archæology*, No. 26; *Proceedings of the Kilkenny Archæological Society*, No. 27. The chief works on the lake-dwellings of Switzerland are Dr. Ferdinand Keller's three papers on *Pfahlbauten*, and Dr. L. Rutimeyer's *Untersuchung der Thierreste aus den Pfahlbauten*, all published in the *Mittheilungen der Antiquarischen Gesellschaft in Zurich*, band ix., xii., xiii.; M. Frederic Troyon's *Habitations Lacustres de la Suisse* (Lausanne, 1857); his *Ossemens et Antiquités du Lac de Moossedorf* in the *Bibliothèque Universelle de Genève*, for May, 1857; his *Details of Discoveries at the Lake Habitations of Switzerland*, in the *Ulster Journal of Archæology*, No. 29; MM. Alb. Jahn and J. Uhlmann's *Die Pfahlbau-Alterthümer von Moossedorf* (Bern, 1857); and M. A. Morlot's *Etudes Géologico-Archéologiques en Danemark et en Suisse* in the *Bulletin de la Société Vaudoise des Sciences Naturelles*, t. vi. (Lausanne, 1860). The Scottish C. are described in the *Proceedings of the Society of Antiquaries of Scotland*, vol. iii., and in Dr Munro's *Ancient Scottish Lake-dwellings or Crannogs* (1882). On pile-buildings generally, reference may be made to Mr. Wylie's paper *On Lake-dwellings of the Early Periods*, in the *Archæologia*, vol. xxxviii., and to papers in the *Gentleman's Magazine* for 1860 and 1861.

CRAPE, a thin fabric made of raw silk, which has been tightly twisted without removing the viscous matter with which it is covered when spun by the worm. It is simply woven as a thin gauze, then dressed with a thick solution of gum, which in drying causes the threads to partially untwist, and thus gives a wrinkled and rough appearance to the fabric. It is usually dyed black, and used for mourning apparel.

CRAS-CROM, an ancient and rude instrument of agriculture in the Highlands, consisting, as its name in Gaelic imports, of a crooked stick shod with iron, with a small projecting bar to rest the foot upon.

CRA'SHAW, RICHARD, an English poet, whose devotional strains exhibit imagination of a high order, with great copiousness and beauty of language, was the son of a clergyman in the English Church, and was born in London, at what date is unknown. He was educated at the Charter-house, and at Cambridge, where he obtained a fellowship in 1637.

He entered the church about 1641, it is said, and became an earnest and eloquent preacher; but in 1644 he was ejected from his fellowship by the parliament, for refusing to take the Cove-

nant. He went to France, adopted the Roman Catholic faith, and suffered great pecuniary distress, until, through Cowley's influence he was introduced to Queen Henrietta Maria, who recommended him to certain dignitaries of the church in Italy. He soon obtained a secretaryship to one of the cardinals at Rome, and was made a canon of the church of Loretto. In this office he died about 1650. In 1634, C. published a volume of Latin poems, in which appeared the famous line, sometimes attributed to Dryden and others, relative to the miracle of the water being turned into wine.

'*Nympha pudica Deum vidit et erubuit.*'
'The modest water saw its God and blushed.'

In 1646 appeared his *Steps to the Temple, The Delights of the Muses*, and *Carmen Deo Nostro*, in which there is much fervid poetry. C. greatly resembles George Herbert in his cast of thought, and is not inferior to him in richness of fancy, though we find in him more exaggeration and conceit.

CRASSULA'CEÆ, a natural order of exogenous plants, some of them shrubby, and some herbaceous, all remarkable for their succulency. About 300 species are known, among which are house-leeks, stone-crops, rose-root, &c. They are widely distributed over the world, but South Africa particularly abounds in them. Most of them grow in dry places, and derive their nourishment from the air rather than from the soil, their roots seeming chiefly intended to fix them to the spot. Many of them are much cultivated in green-houses, more on account of their grotesque forms than for the beauty of their flowers. Some are refrigerant, and one or two are even used as food; others, on account of the tannin which they contain, are astringent; and some are acrid.

CRA'SSUS, the surname of several old Roman families, among which that of the Licinii was most remarkable.—CRASSUS (LUCIUS LICINIUS), born in 140 B.C., was the best orator of his age, and was as distinguished for his wit as for his rectitude in the capacity of proconsul. In 95 B.C. he was elected consul, along with Quintus Mucius Scævola (who had been his colleague in all his previous offices). During their consulship was enacted the *Lex Licinia Mucia de Civibus regundis*, banishing from Rome all who had not the full rights of citizens. This imbittered the feelings of foreigners toward Rome, and partly led to the Social War. As censor, C., in 92 B.C., closed all the schools of the rhetors—asserting that they had exercised a bad influence on the minds of young men. In consequence of the excitement attending a debate in the senate, C. died in 91 B.C.

CRASSUS, MARCUS LICINIUS, the triumvir, was born sometime before 115 B.C. His father and brother suffered death from the party of Marius, 81 B.C., and he himself—though young—was subjected to a jealous and dangerous surveillance. In 85 B.C., to escape from this, he went to Spain. He afterwards joined Sulla (83 B.C.), and distinguished himself in the battle against the Samnites at the gates of Rome. As prætor he crushed the Servile revolt, by the conquest of Spartacus at the battle of Lucania (71 B.C.), and in the following year was made consul with Pompey, a colleague whom he hated. On the other hand, Cæsar valued the friendship of C., the most wealthy of Roman citizens. During his consulate, C. gave a feast to the people, which was spread on 10,000 tables, and distributed a provision of corn for three months. Plutarch estimates the wealth of C. at more than 7000 talents, and Pliny states that the lands of C. were worth 8000 talents. About 60 B.C., Cæsar, Pompey, and C. entered into a private arrangement for their common benefit. This paction is known as the first *triumvirate*. See CÆSAR. In 57 B.C., as consul with Pompey, he gained the province of Syria, and professed to make preparations of war against the Parthians; but the acquistion of more wealth seems to have been his main object, and this he effected by plundering the towns and temples in Syria. At length, however, he set out, but was misguided by a treacherous Arab, and utterly defeated at the river Bilecha by the Parthians. C. now retreated to the town of Carrhæ, intending to pass into Armenia; but was beguiled into a conference with the Parthian general, Surenas, and was slain at the appointed place of meeting. His quæstor, Cassius, with 500 cavalry, escaped into Syria; but the remaining Romans were scattered and made prisoners, or put to death.

CRATAE'GUS, a genus of plants of the natural order *Rosaceæ*, sub-order *Pomeæ*, very nearly allied to *Mespilus* (Medlar) and *Pyrus* (Pear, Apple, &c.), but distinguished by the acute calycine segments, and by the round or oval fruit, closed at the apex, and concealing the upper end of the bony cells. The species are pretty numerous, natives of the temperate parts of the northern hemisphere, and in general have flowers in beautiful terminal corymbs. They are all large shrubs or small trees, more or less spiney, whence the name THORN has been very generally applied to them. The only native of Britain is the common HAWTHORN (q.v.), (*C. oxyacantha*).

Most of the species resemble it considerably in habit, size, form of leaf, &c. A number of them are now frequent in plantations and shrubberies in Britain, of which perhaps the most common is the COCK'S-SPUR THORN (*C. crus-galli*), a native of North America from Canada to Carolina. Its leaves are not lobed; its fruit rather larger than that of the hawthorn. The AZAROLE (*C. Azarolus*), a native of the south of Europe, and the ARONIA (*C. Aronia*), a native of the Levant, are occasionally cultivated for their fruit, which is about the size of the Siberian crab, and is used either for dessert or for pies. *C. Orientalis* (or *odoratissima*) and *C. tanacetifolia* have also fruit of considerable size. The latter is much eaten in Armenia. *C. Mexicana* has a large fruit, like a small apple, but not eatable. It is, however, very ornamental. The wood of most of the species much resembles that of the hawthorn. It is common to graft the rarer species on the hawthorn.—*C. pyracantha* differs much in appearance from most of the genus; being a pretty evergreen shrub, with lanceolate crenate leaves, and rich clusters of red berries, which remain on it all winter; a native of rocky places in the south of Europe and the Caucasus. It is often employed in Britain as an ornamental covering for walls, and is known as the PYRACANTHA.

CRA'TER (Gr. a cup), the central cup-shaped cavity in the summit of a volcano (q. v.), through which the lava, stones, scoria, &c., are for the most part ejected. These materials sometimes escape from immense rents in the sides of the volcano, as was the case in the famous eruption of Hecla in 1783, when two enormous

Crater of Kilauea in the island of Hawaii, Pacific Ocean: Depth about 1500 feet; circumference about 2 miles.

streams of lava poured from its side to the distance, the one of 40, the other of 50 miles. Nor are the volcanic materials, when they escape through a crater, always ejected through the old vent on the summit; some other portion of the mountain may yield more readily to the pressure from within, and thus one or more lateral craters be formed, which, however, increase in height from the accumulation of ejected materials, and eventually, if the eruption continues, overtop the former cone.

CRATI'NUS, a Greek comic poet, born about 519 B.C. Next to his younger contemporaries, Eupolis and Aristophanes, he is the most valuable representative of the Old Attic comedy. He changed its outward form considerably, and also sought to add to its vigor and power. Before his time, the number of actors had been indefinite; he limited them to three. He was the first to make comedy pungent and personal. The habits, manners, institutions—in fact, the whole public and private life of the Athenians—were considered by C. a legitimate mark for censorious satire. The greatest men did not escape. Pericles, for instance, was frequently and fiercely abused. C.'s style was very metaphorical and ingenious. Of his twenty-one comedies, nine of which obtained the first prize in the public competitions, we possess only some fragments. These have been collected by Meineke in his *Fragmenta Comicorum Græcorum* (Berlin, 1840).—There was also a younger CRATINUS, a contemporary of Plato, who belonged to the school of the Middle Comedy.

CRATI'PPUS, a Peripatetic philosopher, was a native of Mitylene, and a contemporary of Cicero. He appears to have been held in the highest estimation by the great men of his age. Cicero calls him the prince of all the philosophers whom he had known. Pompey visited him after his defeat at Pharsalia, and received at his hands the consolations of philosophy; and Brutus went to Athens, to which city C. had latterly betaken himself, to listen to his prelections, even while making preparations to meet Octavius and Antony. Nothing that C. wrote has survived.

CRAYER, CASPAR DE, a Flemish historical and portrait painter, was born at Antwerp in 1582. He lived first at Brussels, and afterwards at Ghent, where he died in 1669. For the churches at Ghent he executed twenty-one altar-pieces. His works are to be found all through Flanders and Brabant. The galleries of

Vienna and Munich also possess a few. Their main characteristics are vigor and boldness of design, and care and truthfulness in execution. Rubens was a great admirer of Crayer.

CRAY'FISH, or CRAW'FISH (*Astacus fluviatilis*), a crustacean of the order *Decapoda* (see CRAB), sub-order *Macroura* (i. e., long-tailed — characterized by the elongation of the abdomen, and its termination in a sort of fin composed of five pieces and expanded laterally); nearly allied to the lobster, from which, however, it differs in having the middle plate of the tail-fin transversely divided by a suture. It inhabits the rivers and streams of many parts of Europe, and is common in some of those of England, making burrows in clayey banks, and coming forth at night in search of food, which consists chiefly of molluscs, small fishes, larvæ of aquatic insects, and animal substances of almost any kind. It is esteemed for the table, and is readily attracted by a bait of decaying flesh or animal garbage, which being enclosed in a net or in a bundle of twigs, numbers of C. may be captured at a time.—Other species of C. abound in some of the warmer parts of the world. See Huxley's *Crayfish* (1879).

Crayfish (*Astacus fluviatilis*).

CRAYON (Fr. a pencil). Though used in French, and occasionally in English, to designate pencils generally, including those made of lead, the word C. is more frequently applied, in England, to those small cylinders of charcoal, or of pipe-clay or chalk colored with various pigments, which are used for drawing. Cohesiveness is given to the paste of which the cylinders are formed by means of gum, wax, soap, &c. C. drawings are often remarkable for the delicacy and softness with which objects are represented, but they are deficient in power. See PENCIL, CHALK.

CREAM, the butyraceous and richer portion of milk, which as lighter rises and settles on the surface. See MILK. The term C. is applied in a variety of ways, indicative of something superior in quality; as, *Cold Cream* (q. v.), and *Cream of the Valley*, a fine kind of English gin. The French, in referring to persons in the height of fashion, speak of *La crême de la crême*—The cream of cream.

CREAM OF TARTAR exists naturally in grape juice, but being insoluble in alcohol, it is gradually deposited, in the form of argol, as the sugar of the juice becomes converted into alcohol by fermentation. In the preparation of C. of T., the argol is dissolved in hot water, to which charcoal or fine clay is added, to take up the coloring matter; by boiling and filtering, a clear colorless solution is obtained, from which, on cooling, the C. of T. separates as crystals. Some of the crystals form at the bottom; others form a crust on the top, like cream, whence the name cream of tartar. In chemical composition, it is the Bitartrate of Potash (KO,HO,T), and contains potash, water, and tartaric acid. It is readily soluble in hot water, though it takes 60 parts of cold water to dissolve one part of the cream of tartar. It has an acid taste, and gritty feel. When taken repeatedly in small doses of a scruple to a drachm, it acts as a refrigerant and diuretic; in doses of one to two drachms, it is useful as an aperient; and in larger doses of from two to three drachms, it acts as a purging agent, accompanied by flatulence and griping. *Imperial liquid* is prepared by dissolving about a drachm of C. of T. in a pint of boiling water, and adding a little lemon-peel and sugar to flavor it; when an agreeable refrigerant drink is obtained, which is highly serviceable in allaying thirst in feverish cases. C. of T. whey is obtained by adding two drachms of the salt to a pint of milk.

CRE'ASOTE, or KRE'ASOTE, is an artificial organic substance, generally obtained from the products of the destructive distillation of wood. It is procured incidentally as one of the constituents of wood-tar, from which it is separated by a tedious process. The principal supplies are obtained from Stockholm, Archangel, and America. In the pure condition, C. is a colorless oily liquid, with high refractive powers; but the commercial specimens are generally colored yellow or light brown. It boils at 398° F.; does not readily inflame; but when set fire to burns with a smoky flame. It has a hot burning taste, and is very poisonous to plants and animals. It has a great power of coagulating albumen, and hence may be employed with advantage in toothache; a drop placed on the exposed nerve coagulates the albuminous tissue, and destroys its vitality and sense of pain. The most important property possessed by C., however, is its antiseptic or preserving power over vegetable and animal organs and structures. Thus, ordinary meat treated with only one-hundredth of its weight of C., and exposed to the air, does not putrefy, but becomes hard and dry, and assumes the taste and odor of smoked meat. Again, timber treated with C. does not suffer from dry-rot or other disease; and thus C., in a crude form, is employed in the preservation of wood (q. v.). The crude pyroligneous acid of commerce, which is often employed in the curing of hams, &c., owes part, at least, of its preserving powers to the presence of a trace of C., which leaves its characteristic odor so well known as obtained from the burning of wood for the smoking of hams, &c.

When used medicinally, C. acts externally by destroying the cuticle; internally, in small doses of a drop or two, it is serviceable in arresting obstinate vomiting; whilst in large doses it produces nausea and severe vomiting, and, in many cases, fatal results.

CRE'ATINE, or KRE'ATINE (Gr. *kreas*, flesh), was discovered in 1835 by Chevreul, but little was known about it till Liebig published his *Researches on the Chemistry of Food*, in 1847. From his investigations, and those of subsequent chemists—amongst whom we may especially name the late Dr. William Gregory of Edinburgh—the following facts regarding its properties and occurrence have been established.

C. forms transparent, glistening crystals, belonging to the clinorhombic system, and usually occurring in groups, the character of which is exactly similar to that of sugar of lead. Although usually grouped among the basic bodies, it is neutral in its reaction. It dissolves in 74·4 parts of cold water, and in boiling water in such quantity that the solution on cooling solidifies into a mass of delicate needles. These crystals contain two atoms of water and one atom of anhydrous C., whose composition, according to Liebig, is represented by the formula $C_8H_9N_3O_4$. There is no direct chemical test for the detection of C., and the methods which have been employed to obtain it are too complicated for insertion in this article.

C. is constantly present in the juice both of voluntary and involuntary muscles. The quantity differs in the flesh of different kinds of animals, and even in different muscles of the same animal, but is always very small; and lean animals yield relatively more than fat ones. According to Liebig, the flesh of hens yields the largest amount, viz., 0·32 per cent., the average quantity from horse or ox flesh being 0·07 per cent. Gregory determined its amount in the flesh of various mammals, birds, and fishes; and Schlossberger found 0·067 per cent. in human flesh. It has likewise been detected in very small quantity in the blood of oxen, also in the liquor amnii of women who have died in advanced pregnancy, and it can usually be obtained from the urine, although it is doubtful whether it is a normal constituent of that fluid. It does not exist in the liver or kidneys, but has been found among the soluble constituents of the brain.

Although the view has been advocated that, from its occurrence in flesh, and from its large amount of nitrogen (32·06 per cent.), it must be an important nutritive agent, there are most decisive reasons for opposing this opinion, and for ranking it among the products of excretion; for, in the first place, if it could be employed with further advantage in the organism, it (or its near ally, creatinine) would not be allowed to escape by the kidneys; secondly, the readiness with which it may be converted into unquestionable products of excretion (as, for instance, into urea, by the action of heat and baryta water), proves its approximation more nearly to these substances, than to such bodies as albumen or fibrin; and thirdly, there is no instance of a tissue-forming food occurring in a crystalline form.

CREA'TININE is closely allied in its chemical and physiological relations to creatine. Liebig found that, when heated with a strong mineral acid, a solution of creatine no longer yields crystals of that substance, but a new body of totally different chemical properties, to which he gave the name of creatinine. Its chemical composition is represented by the formula $C_8H_9N_3O_2$, and on comparing this formula with that for creatine, we see that the conversion of the latter into the former, by the action of mineral acids, depends upon the separation of the elements of water. Liebig shortly afterwards detected C. as a constituent of the muscular juice. In the latter fluid, it occurs in less quantity than creatine; while in the urine, where it is also found, it is the more abundant of the two. Traces of it have also been found in the blood and in the liquor amnii.

C. crystallizes in oblique rhombic prisms, is a most decided alkoloid, reacting strongly on vegetable colors, and having almost as caustic a taste as ammonia; it further differs from creatine in its far greater solubility in water, alcohol, and ether. There can be little doubt that C. takes its origin from creatine.

CRÉBILLON, PROSPER JOLYOT DE, a French dramatist, was born at Dijon in 1674. He was sent to Paris to study law, but ended by devoting himself wholly to poetical pursuits. His first piece, *La Mort des Enfants de Brutus*, was rejected by the actors; but the succeeding dramas of *Idoménée* (1705) and *Atrée* (1707) were successful. *Rhadamiste* (1711), a tragedy of the dismal kind, was reckoned C.'s masterpiece, and established his reputation. After pro-

ducing some other pieces, C. fell into pecuniary difficulties and neglect, and for more than twenty years produced nothing. His talents were then called again into requisition by Madame de Pompadour, who wished to humble Voltaire. He received from the king a pension of 1000 francs, and completed the tragedy of *Catilina*, for which the king himself supplied all the properties. When 81 years old, C. wrote his tragedy *The Triumvirate*, and still later, commenced, but did not finish, another called *Cleomède*. He died June 17, 1762, and Louis XV. erected a monument to his memory. C., in general, displays little skill in the conduct of his plots; the monologues of the speakers are too numerous and too long; but in the opinion of his countrymen he is surpassed, in 'the grandeur of his sentiments,' only by the author of the *Cid* and *Horace*. The best edition of C.'s works is that published by Didot (2 vols., Paris 1818).

CRÉBILLON, Claude Prosper Jolyot de, the younger, son of the dramatist, was born in Paris, February 14, 1707. In an age of licentious manners, he acquired popularity by a series of romances, remarkable chiefly for their violation of decency; the principal of which are *Le Sopha*, *Le Hasard du Coin du Feu*, *Les Egarements du Cœur et de l'Esprit*. His own moral character is described as correct, but his writings undoubtedly served to extend the influence of the immoralities which he described. C. died in Paris, April 12, 1777.

CRÉCY, or CRESSY, a small town of France, in the department of Somme, situated on the Maye, about 12 miles north of Abbeville. C. is chiefly celebrated on account of the brilliant victory obtained here, 26th August 1346, by Edward III., with 40,000 English soldiers, over a French army amounting, according to Froissart, to 100,000 men, under the command of the Count of Alençon. In this great battle, one of the most honorable to English prowess recorded in history, the flower of French chivalry was slain, as well as the kings of Bohemia and Majorca, who were fighting on the side of France. Altogether, about 30,000 of the French army bit the dust. In this battle the Black Prince, who greatly distinguished himself, gained his spurs; and the crest of the slain Bohemian king, composed of three ostrich feathers, with the motto, *Ich Dien*, 'I serve,' was adopted by him in memory of the victory, and still continues to be borne by the Prince of Wales. C. is an ancient place, but its population in 1872 amounted to only 1359.

CRE'DENCE, a small table beside the altar or communion-table, on which the bread and wine are laid before being consecrated. In the Greek Church this is called the *Trapeza Prothesis*. Archbishop Laud was a great stickler for the C., and pleaded the authority of Bishop Andrews and other bishops for its use. There are credences in various Anglican churches; among others, in the Collegiate and St. John's Churches, Manchester; and in the parish church at Ludlow, where they have been in use from time immemorial. Sometimes the place of the C. was supplied by a mere shelf across the fenestella (q. v.). The term was also used for a buffet, or sideboard, at which the meats were tasted in early times before being presented to the guests, as a precaution against poison. Hence the origin of the word, which is derived from the Ital. *credenzare*, to taste meats and drinks before they were offered to another, an ancient court practice, which was performed by the cup-bearers and carvers, who for this reason were called in Ger. *credenzer*. The getting up of credences or side-altars is one of those restitutions of old usuages which has marked the Puseyite movement in England. See Pusey.

CREDE'NTIALS, papers or letters given to an ambassador, or other public minister, to a foreign court, in order to enable him to claim the confidence of the court to which he is sent.

CRE'DIT, in Political Economy, is one of many terms used in that science, of which it is said that we yet possess no scientific definition. This is the less to be regretted, as the practical meaning of the word is thoroughly known, so as to enable every one to understand what is meant, when economists speak of the extent to which C. is safe and proper, unsafe or improper, in this or that class of cases. We have come, perhaps, thus far towards an exact scientific notion of the nature of C., that while it serves the purpose of capital, it can only do so while there is capital ready to come and take its place if necessary. Credits which are not in this position—though they may happen to serve their turn, as a ship may sail some distance unwrecked without a steersman—do not accomplish the purpose of capital. The real power of C. properly resting on capital, is that it enables that capital to be devoted to more than one purpose. A bank is a great emporium of C.; that is to say, it consists of a certain amount of capital, which can be operated on by a whole community—not all at one time, but by individuals as occasion requires. Thus, a comparatively small stock of money can be made to do duty for carrying on numerous transactions. But it is indispensable for insuring a safe system of C. that money must be instantly available when wanted; and this principle applies not alone to banking, but to every species of transaction in which postponed payment is concerned. Unfortunately, this principle is too often set aside, and C. is grossly abused. The facts brought out in great bankruptcies generally teach the moral, that men who have every element of human wellbeing in their power, ruin themselves both in purse and fortune, by trying to make £30,000 do the work of £100,000. In many bankruptcies, too, there is a curious illustration of the power of C. as a representative of capital, in enabling men to keep up for a considerable time the appearance of being wealthy traders, though they never had a farthing they could honestly call their own. In the few instances where such projects succeed, there is the kind of applause which is given to the successful winner in any game of chance; and it is naturally felt that if the successful are applauded, it is hard to condemn the unsuccessful; so that there is perhaps a dangerous leniency in public opinion towards speculators on credit.

In a modified shape, C. is a thing which, to all appearance, can never be abolished. There is scarcely a human being in a civilized country, who does not transact a piece of credit business almost every day of his life. The workman hired by the week, and paid at its end, gives his employer C. from Monday morning to Saturday evening. The same workman, when getting a coat made for himself, even although he engaged to pay ready money on delivery, gets C. from the tailor during the making.

It is necessary to consider these things, because a course of C. is often so hurtful to people of the working-classes, by fastening ruinous obligations on them, that some people have proposed to abolish all C. where they are concerned, by rendering them free from all legal procedure for the recovery of debts. The answer to this is, that although it is practicable to relieve any class from obligations, and their legal enforcement, it is impossible in a trading country to suppress debt and credit. It is practicable, however, so far to modify the legal remedies against debtors of the poorer class, that there may not be, as there too often is, a temptation to traders to transact a special business, in holding out temptations to working-people to purchase on credit.

CREDIT, Cash. See Cash Account.

CREDIT, Letter of. This is the term applied to accounts, usually in the form of a *letter*, addressed by one party to another, whereby the former requests the latter to pay a sum therein specified to the bearer of the letter, or some other third party named in it, and authorizes him to reimburse himself for such payment, either by debiting it in account between the parties, or by drawing on the first party for the amount. This arrangement may take place between merchants and others, but in general it occurs between *bankers* residing in different places—as, for example, between a banker in Edinburgh and his correspondent in London; and it is designed for enabling a party who has money lodged at either place, to obtain the use of it at the other, without the risk or trouble of actually carrying it between the two cities. For this convenience a small charge is made by the bank issuing the letter, termed the exchange or commission. Sometimes the letter is addressed to *all* or *several* of the correspondents of the bank issuing it, in which case it is termed a *Circular Credit;* and any of them may pay the sum mentioned, or sums to account as desired, taking the holder's receipt, or his draft on the granter, in exchange; and the sums so paid are *indorsed* on the letter, to show how far the credit has been used. If the party holding a circular letter can be properly introduced, even at a place where the granter has no correspondent, little difficulty will be experienced in obtaining money upon it; and the practice is to reimburse any one who has given the money, if within the amount of the credit. It will thus appear that the system is productive of much convenience to all parties who have occasion to travel, or transact business away from home, especially in foreign countries, where it might be difficult otherwise to make their way, except by carrying with them an unsafe amount of coin or other valuables.

Some bankers, having an extensive correspondence abroad, issue what are called *Circular Notes*, usually of the value of £10 or £20 each, which any of the granter's correspondents, or indeed any one else, may cash to the holder, on his 'indorsation;' but a third party must take his risk of its being questioned. For this kind of credit, the receiver at once reimburses the granter; whereas for the ordinary letter of C., he is only reimbursed when the drafts under it are advised to him, the holder continuing during the interval to raise interest on his money deposited for covering it. The circular-note plan was devised about 1770 by Mr. Herries, the founder of the eminent London banking-house of Herries, Farquhar, and Company, who had originally been a continental merchant, and well knew the difficulties which travelers or traders then had to encounter in foreign countries. Although the system is now highly appreciated, it cost him no little trouble and perseverance to establish it in public estimation See Circular Notes.

CREDIT FONCIER, a peculiar method of borrowing money in France on the security of landed property, It was established

by an edict of 28 February 1852. Its peculiarity is, that the repayment of the loan is by an annuity terminable at a certain date; the date and the amount of annuity being so calculated, that when the last payment is made, the loan and the interest on it will be extinguished. Another method of describing it is as a loan repayable by instalments. The transaction is precisely regulated by the edict, which prohibits an advance on more than half of the value of the property pledged or hypothecated. Three several companies were established by the French government, with the privilege of making such advances.

CREDIT MOBILIER. See MOBILIER.

CRE'DITION, or KI'RKTON, a borough in the middle of Devonshire, on the Creedy, a tributary of the Exe, 8 miles north-west of Exeter. It lies in a narrow vale between two steep hills. Pop. (1881) 4541. At C. was born the Anglo-Saxon Winfred, or St. Boniface, who was the first to preach Christianity in Central Germany, founded the monastery of Fulda, and was Archbishop of Mainz. C. was the seat of a bishopric from 909 to 1050, when the sees of Devon and Cornwall were united and placed at Exeter. The chief manufactures were formerly woollens and serges, but now shoes. C. was much injured by fires in 1743 and 1769.

CRE'DITOR. See DEBTOR, BANKRUPT.

CRE'DO (Lat. *I believe*), a part of the service of the mass, beginning with the words, *Credo in unum Deum*.

CREEDS AND CONFESSIONS are the names given to the authorized expressions of the doctrine of the church at large, or of the several main sections into which it is divided. Such statements of doctrine sprang up naturally in the course of the church's progress. As the simple truths taught by Christ in an unreflective and mostly concrete form became the subjects of thought, of argument, of controversy, they could not fail to receive a more defined intellectual expression, and to be drawn out into more precise dogmatic statements. Men's minds could not be exercised on subjects of such vast importance to them without this result; and the great creeds, as they rise in succession before us, and mark the climax of successive controversial epochs in the church, are nothing else than the varied expressions of the *Christian consciousness and reason*, in their efforts more completely to realize, comprehend, and express the originally simple elements of truth as they are recorded in Scripture. The study of the creeds would be nothing else than the study of theology in its highest historical development—in its reflex settlements after the great agitations of Christian thought had run their course.

Corresponding to this view, we find that the creeds of Christendom grow in complexity, in elaborate analysis and inventiveness of doctrinal statement, as they succeed one another. The first are comparatively brief and simple in sense and form; the last are prolix and largely didactic. From the Apostles' Creed to the decrees of the Council of Trent, or the chapters of the Westminster Confession of Faith, there is a wide change, during which the Christain consciousness has grown from a childlike faith to a critical opinionativeness.

What has been called the *Apostles' Creed* is the earliest form of Christian creed that exists, unless we give the precedence to the baptismal formula at the close of St. Matthew's Gospel, out of which many suppose the Apostles' Creed to have grown. There were in the early church differing forms of this primitive creed: that which is received and repeated in the service of the Church of England, has come to us through the Latin Church; and in several of its clauses, as, for instance, 'He descended into hell,' and again, 'The communion of saints,' is supposed to have been interpolated according to later notions. A great variety of opinions has been held as to the origin of this creed. The Roman Catholic Church has not only attributed it to the apostles directly, but profess to settle, on the authority of a spurious sermon of St. Augustine, the clauses respectively contributed by the several apostles: 'Petrus dixit, Credo in Deum Patrem omnipotentem. Joannes dixit, Creatorem cœli et terræ. Jacobus dixit,' &c. The earliest account of its origin we have from Rufinus, a historical compiler and traditionalist of the 4th century.

His statement is, that the apostles, when about to separate to preach the truth to different nations, agreed upon a 'form of sound words' which should express the sum of their common teaching. 'When met together, and filled with the Holy Ghost, they composed this compend of what they were to preach, each one contributing his share to the one composition, which they resolved to give as a rule of faith to those who should believe.' No great weight belongs to this testimony; Rufinus is no historical authority. It is not improbable in itself, however, that even in the age of the apostles some formula of belief existed. The exact form of the present creed cannot pretend to be so ancient by four hundred years, but a form not much different from it was in use long before. Irenæus, the scholar of Polycarp, the disciple of St. John, when he repeats a creed not much unlike to the present, assures us that, 'the church dispersed throughout the whole world had received this faith from the apostles and their disciples;' and Tertullian also affirms that a similar creed had been 'prevalent as a rule of faith in the church from the beginning of the gospel.' The same thing is proved by the creeds administered to the candidates for baptism in the 2d and 3d centuries. They correspond, with slight variations, to the Apostles' Creed. The true view of this formula of church belief, therefore, seems to be that which regards it as the Roman or Latin form of the creed which prevailed in all the early churches. It is not strictly apostolic—certainly not in the order of words derived through the Latin Church, in which it is now received and repeated; but it is substantially apostolic—fairly representative of the different elements of Christian faith as handed down from the apostles, and well claiming, therefore, the credence of the universal Christian church. Since the Reformation in England, it has been the usage to exhibit the Apostles' Creed and Ten Commandments in legible characters on boards near the communion-table in churches, in order that they might be seen and repeated by the common people, who were unprovided with books.

The *Nicene*, or rather, the Niceno-Constantinopolitan Creed, is the next great expression of doctrinal truth that we meet with in the history of the church. It sprang out of the conflict, which had begun even in the 2d c., as to the dignity and character of Christ. From the beginning, Ebionitism had looked upon Christ as merely a Jewish teacher of distinction; Theodotus and Artemon openly taught such a doctrine in Rome towards the close of the 2d century. Others, on the contrary, taught a doctrine which identified Christ with God absolutely in such a manner as to destroy all distinction of persons in the Godhead. Monarchianism, as it was called, which held rigorously and formally to the unity of God, was the ruling principle of both doctrines, opposite as were the expressions it assumed in the two cases.

The controversy thus begun in the 2d, perpetuated itself in the 3d c,. under various modifications. Paul of Samosata carried out the Unitarian tendency, which reduced Christ to the level of a mere man; Sabellius carried out the same tendency in the opposite direction, which made Christ not merely divine, of the same substance with the Father, but looked upon him as merely a manifestation of the Father, without any distinct personality. Sabellianism recognized a Trinity of manifestations, but not a Trinity of essences. God was one and all-comprehending, and the Son and the Spirit were merely names or expressions for the different modes in which he reveals himself. Sabellius flourished about the middle of the 3d c., and Paul of Samosata somewhat later. Arius who was a presbyter of Alexandria, grew up in the midst of these heretical influences, and soon distinguished himself in the Alexandrian church for his advocacy of the doctrine that Christ, although in a true sense divine, or the Son of God, was yet not the very God. He denied that he was 'of the substance of God,' or 'without beginning;' he was only the highest of created beings, in a sense divine, but not the same in substance with the Father, nor equal with him in power and glory. Athanasius came forward as the opponent of Arius, and the contest between them raged keen and wide throughout the church.

The Council of Nicæa was summoned in 325 by Constantine, with the view of settling this controversy; and the Nicene Creed was the result. There were these three parties in the council—the Athanasians, or extreme orthodox party; the Eusebians, or middle party; and the Arians, or heretical party. The heretics were few in number, and possessed but little influence; but the Eusebians were a strong party, and, for sometime resisted certain expressions of the orthodox or Athanasians, which seemed to them extreme and unwarranted; but at length the Homöousians, as they were called, carried the day; and Christ was declared not merely to be of like substance (*homoiousios*) but of the substance (*homöousios*) with the Father. At the later Council of Constantinople, the additional tenet of divinity of the Spirit was added, and the creed completed in the form in which it is familiar to the English reader in the communion service in the Book of Common Prayer. In it we confess, as has been said, to the holy and undivided Trinity, and distinctly own the divinity of each person. We commemorate the creation of the world by 'God the Father Almighty;' we acknowledge Jesus Christ to be our 'Lord;' to have been 'begotten' from all eternity; to be 'of one substance with the Father,' and with him Creator of all things; that 'for our salvation he came down from heaven, was made man, and suffered and died for us.' We commemorate his resurrection, ascension, and sitting at God's right hand; express our expectation of his second coming; and declare that 'his kingdom shall have no end.' We confess to God that He hath appointed baptism for the remission of sins, and given us leave 'to look for the resurrec- of the dead' and 'the life of the world to come.'

The next remarkable monument of doctrinal truth in the church is what is called the *Athanasian Creed*, a product of the 5th c., much later than Athanasius himself, but representing, with great formal minuteness and fidelity, his doctrine of the Trinity, as apprehended

and elaborated by the Western Church. See ATHANASIAN CREED.

The Apostles', the Nicene, the Athanasian, may be said to form the great catholic creeds of the church. After the time of the last-mentioned formula, there is no general symbol of faith that claims our attention till the period of the Reformation. Theology continued to be cultivated during the middle ages, and especially during the 12th and 13th centuries, with great assiduity. Scholasticism is nothing else than the vast expression of the intellectual labor bestowed upon this subject during these ages, when scarcely any other subject can be said to have engaged men's minds. It was characteristic of scholasticism, however, to work mainly upon the doctrinal *data* already adopted and authorized by the church, developing these data in endless sentences and commentaries. There was, withal, no real freedom of inquiry, nor life of speculation. But as soon as the eye of free criticism and argument was turned upon Scripture with the Reformation, new Creeds and Confessions began to spring up. On the one hand, Protestantism had to defend its position and its scriptural authority by appeal to its system of belief; and, on the other hand, the Church of Rome, after many delays, gave forth at the Council of Trent (1545—1563), a more extended and detailed statement of its doctrine than was to be found in any previous creeds. The *Decrees of Trent* are the fixed authoritative symbol or confession of faith of the Church of Rome.

Of the Protestant churches, the most notable confessions of faith are the Lutheran; the continental Calvinistic or Reformed; the Anglican, or Thirty-nine Articles of the Church of England; and the Puritan, or Westminster Confession of Faith.

The Lutherans call their standard books of faith and discipline, *Libri Symbolici Ecclesiæ Evangelicæ;* and reckon among them, besides the three catholic creeds, the Augsburg Confession (q. v.), the Apology for that confession by Melancthon, the Articles of Smalkald drawn up by Luther, Luther's Catechisms; and in some churches, the Formula of Concord, or the Book of Torgau.

Of the continental Calvinistic or Reformed Churches, there are numerous confessions, the principal of which are—1. The Helvetic Confessions—that of Basel, 1530, and Bullinger, *Expositio Simplex*, 1566; 2. The Tetrapolitan Confession, 1531; 3. The Gallic Confession, 1559; 4. The Palatine or Heidelberg Confession, 1575; 5. The Belgic Confession, 1559.

The *Thirty-nine Articles* of the Church of England have been already described. See ARTICLES. They were originally forty-two, and are supposed to have been chiefly composed by Cranmer. In 1571, they were revised and approved by convocation and parliament.

The Westminster *Confession of Faith* was the product of the great Puritan agitation in the 17th century. As soon as the Long Parliament assembled in 1640, it set itself to consider the question of the reformation of religion. It carried resolution after resolution directed against the existing government of the Church of England; and at length, on the 23d of November, 1641, it passed the famous Remonstrance, in which it proposed that, 'in order the better to effect the reformation in the church, there should be a general synod of grave, pious, learned, and judicious divines, who should consider all things necessary for the peace and good government of the church.' Out of this proposal sprang the Westminster Assembly, although the parliamentary ordinance actually summoning the Assembly was not issued till a year and a half later—viz., June 12, 1643. According to this ordinance the Assembly was to consist of 121 clergymen, assisted by 10 lords and 20 commoners as lay assessors. Many of these appointed members, however, never took their seat in the Assembly. The bishops were prevented from doing so by a counter ordinance of the king.

Among the most notable divines who did assemble were Burgess, Calamy, Gataker, and Reynolds, and Gillespie, Henderson, Baillie, and Samuel Rutherford, the commissioners from Scotland, of the Presbyterian party; Goodwin, Nye, and Burroughs, of the Independent party; and Lightfoot and Coleman, with Seldon, of the Erastians. The Presbyterians greatly predominated, and the acts of the Assembly bear throughout the stamp of Calvinistic Presbyterianism. It began its sittings in the autumn of 1643, and sat till the 22d February, 1649, having lasted upwards of five years and a half. During this period it had met 1163 times.

The most important labors which it achieved were the Directory of Public Worship and the Confession of Faith. This latter document was completed in the third year of its existence (1646), and laid before parliament in the same year. It was approved by the General Assembly of the Church of Scotland in 1647, and again in 1690, on the renewed establishment of Presbyterianism after the Revolution.

The Confession of Faith, as it is the latest of the great Protestant creeds, so it is one of the most elaborate of them all. It extends to thirty-three chapters, beginning with *Holy Scripture*, and ending with *The Last Judgment*. Of its thirty-three chapters, twenty-one may be said to be distinctly doctrinal—the first nineteen and the last two. The others concern such subjects as *Christian Liberty, Religious Worship, Oaths and Vows*, the *Civil Magistrate*, the *Church*, the *Sacrament, Synods and Councils*.

The tone of the doctrinal chapters is that of the later and formal Calvinism which spread from Holland among the English Puritans. The ecclesiastical spirit is Puritan-Presbyterian. 'God alone' is declared to be 'Lord of the conscience;' yet the 'publishing of opinions contrary to the light of nature, or to the known principles of Christianity,' is at the same time declared to be matter of censure by the church, and of punishment by the civil magistrate. In composition, the Confession is an able and comprehensive summary of theological truth, showing great logical skill in the deduction of particular doctrines from certain main principles. The third chapter, *Of God's Eternal Decree*, may be said to be the key-note from which its most characteristic doctrines follow in immediate sequence and harmony. It is well deserving the attention of all students of theology, not only as a remarkable monument of Christian learning, but as the most representative expression of a great spiritual movement which has deeply tinged the national thought of Britain, and modified the course of its history. It is issued, under authority, as a cheap duodecimo volume by printers in Edinburgh, for general use throughout Scotland. Incorporated in the volume is the text of the Covenants, but these are not esteemed part of the Confession. See COVENANTS.

CREEK, in Geography, is a small inlet on a low coast, and in rivers formed by the mouths of small streams. In America, the term C. is applied to small inland rivers.

CREE'PER (*Certhia*), a genus of birds, the type of the family *Certhiadæ;* having a longish, slender, arched, and pointed bill; a

Common Creeper (*Certhia-familiaris*).

long, narrow, sharp-pointed tongue, jagged near its tip; the tail rather long, and the tips of the tail-feathers firm and pointed, extending beyond the webs. The feet are rather slender; the hinder toe about as long as the other toes. Of this conformation of feet and tail great use is made in climbing trees, the stiff feathers of the tail being employed for support. Although the family is large, it is doubtful if the genus contains more than one true species, the COMMON C. (*C. familiaris*), a bird found in all temperate parts of the northern hemisphere, wherever wood abounds.

It is common in Britain, but it is not so well known as many other birds, in consequence of its restless habits, its rapid movements, and prompt retirement to the opposite side of a tree or branch from a spectator. It searches for insects and their larvæ in the crevices of the bark, and generally ascends from the root to near the top of a tree before it flies off to another tree or branch. It generally builds its nest in a hole of a decayed tree. It is one of the smallest of British birds, although considerably larger than the wren. Its note is monotonous, and often repeated. Its prevalent color is reddish-brown above, different shades being beautifully intermingled, and speckled with white; the under parts white. In Scotland, it is frequently called *Bark-speeler* (Anglicè, Bark-climber).—The WALL C. (*Tichodroma muraria*) of the south of Europe, frequents walls and the faces of rocks; it has a more slender bill, and the tail-feathers are not pointed.

CREEPS, a miner's term for the depression which takes place on the surface from the removal of beds of coal beneath. Masses of the coal-seam, like huge pillars, are left by the miners for the support of the superincumbent strata; the pressure, however, of these beds is so great that, in course of time, the ceiling gradually sinks, or, as is more frequently the case, because of the ceiling consisting of hard rock, the softer shale pavement rises, until the intervening spaces between the pillars, left by the removal of the coal are filled up. A consequent depression takes place in the beds above, as also an alteration of the surface-level. But this

being so gradual is seldom noticed, except when it is made evident from the accumulation of surface-water, or in districts where railways pass over the coal-fields.

CRE'FELD. See KREFELD.

CRE'MA, a town of Lombardy, province of Cremona, situated on a plain 25 miles E.S.E. of Milan. C. has an old castle and cathedral. Pop. (1881) 9111.

CREMATION, the reduction of the dead human body to ashes by fire, was a very early and widespread usage of antiquity. The early Aryans, as opposed to the non-Aryan aborigines of India, Greeks, Romans, Slavs, Celts and Germans, burned their dead, so that C. may be regarded as the universal custom of the Indo-European races. The graves of North Europe throughout the 'bronze age' contain only jars with ashes. It was Christianity that gradually suppressed the practice of cremation. In India it is still a usual method for disposing of corpses, and is practiced by numerous uncivilized peoples of Asia and America (see BURIAL). A return to the practice has been strongly insisted on by many in modern Europe. This is opposed mainly on grounds of kindly feeling for the dead, and for religious reasons, connected with the belief in the resurrection of the dead. Advocates of cremation assert that these are prejudices founded on misapprehension, and allege that the question is solely a sanitary one.

The damage to the health of such as live near church-yards and cemeteries, from the exhalations of noxious gases and the poisoning of water supplies, is an indisputable fact, and is in many cases quite inevitable. By burning, the body is reduced more swiftly to its constituent elements, without disrespect to the dead, or hurt to the living. In Italy cremation has been legal since 1877, and is not unusual at Milan, Lodi, and elsewhere. In Berlin, Dresden, and Leipzig there has been strong agitation in favor of cremation: and at Gotha there is a large mortuary and crematorium, where between 1878 and 1881 upwards of 50 dead bodies were consumed by fire. Societies for securing the legalisation of the process exist in Holland, Belgium, France, England, and the United States. Interest in this movement was awakened in England in 1874 by Sir Henry Thompson: the council of the society established in that year purchased ground at Woking in Surrey, in 1878, and there erected a crematory on the principle of that at Lodi. This apparatus reduced part of the carcase of a horse weighing 140 lbs. to 6 lbs. of white ashes in two hours; but a special act legalising cremation of human corpses is still awaited by the society. The human body consists of 60 per cent. of water and 40 per cent. of solid matter; and quickly to reduce this to ashes requires a strong furnace. A special form of Siemens' regenerator furnace is that which has found most favor. The essential parts of the apparatus, besides the furnace, are a hall, a receiver, and a tall chimney. The literature of the subject is extensive: see Thompson, *The Treatment of the Body after Death* (1874); Eassie, *Cremation of the Dead* (1875); Ullersperger, *Urne oder Grab* (1874).

CREMO'NA, an important city of Northern Italy, situated on the north bank of the Po, which is here crossed by a bridge, about 48 miles south-east of Milan. It is surrounded by walls with flanking towers and wet ditches, its circumference being nearly 5 miles. A canal uniting the Oglio and the Po passes through the city; and the latter river is navigable for large boats from this point to the sea. The streets of C. are wide and regular, and it has some fine buildings—the principal of which are the cathedral, dating partly from 1107, but exhibiting various styles of architecture; several other churches; the Palazzo Publico, Campo Santo, and the Torazzo or belfry—one of the loftiest and finest towers in Italy, being 396 feet high, and commanding magnificent views over the fertile plains of Milan. By means of the Po, C. carries on a considerable trade in the produce of the district; and it has manufactures of silk, cotton, earthenware, and chemicals. It was formerly greatly celebrated for its manufacture of violins, the most famous maker being Amati, who flourished in the beginning of the 18th century. Pop. (1881) 31,930. C. is the capital of a province of the same name; area, 650 square miles; pop. (1881) 302,064.

CRENE'LLE, sometimes used for a Battlement (q. v.), or the embrasures in a battlement.—CRENELLE, in Heraldry, embattled, signifies that any ordinary is drawn like the battlements of a wall.

CRE'NIC A'CID is one of the constituents of vegetable mould, and is produced wherever leaves and other plant matter are decaying, especially in peat-bogs and marshes.

CREO'LE (Span. *criollo*) is a word used of the inhabitants of South America, the West Indies, and Mauritius. In its widest sense, it designates any one born in the country, but of a race not native to it. It is usually applied, however, to persons born in the colony or country, and of pure European blood, as distinguished from immigrant Europeans, and also from the offspring of mixed blood.—CREOLE LANGUAGES are corruptions of Dutch, French, Spanish, Portuguese, English, arising in various colonies.

CRESCE'NDO, in Music, means a gradual increasing of sound, or changing from piano to forte and fortissimo. The swell of a good organ produces a most perfect crescendo.

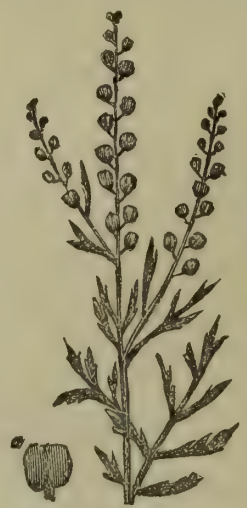
CRE'SCENT. A representation of the half moon with the horns turned upwards, called a C., is often used as an emblem of progress and success. It was the emblem of the Greek before it became that of the Turkish rule; and at the present day, is frequently to be seen on churches in Moscow and elsewhere in Russia, generally surmounted with the cross.

CRESCENT, TURKISH ORDER OF. In 1799, after the battle of Aboukir, the Sultan Selim III. testified his gratitude to Nelson by sending him a C. richly adorned with diamonds. It was not intended as an order, but Nelson wore it on his coat, and called himself the knight of the C. Selim was flattered by the value attached to his gift, and resolved, in 1801, to found the Order of the Crescent. Mohammedans being forbidden in the Koran to carry such marks of distinction, the order is conferred only on Christians who have done service to the state. See MEDJIDIE, ORDER OF. There was an old order of the C., instituted by René, Duke of Anjou, in 1464.

CRESCENT, in Heraldry, is used both as a bearing or charge, and as a difference, or mark of cadency. In the latter case, it designates the second son, and those that descend from him. See CADENCY.

CRESCE'NTIA. See CALABASH TREE.

CRESS, a name given to many plants, of which the foliage has a pungent, mustard-like taste, and is used as a salad. It is sometimes more strictly confined to the genus *Lepidium*, a genus of the natural order *Cruciferæ*, having small white flowers, and oblong or rounded laterally compressed pouches (silicules), with the cells one-seeded, and the valves keeled or winged on the back. The COMMON C., or GARDEN C. (*L. Sativum*), is an annual, a native of the East, frequently cultivated in our gardens, and used in a young state as a salad; being easily procured in a few weeks from the time of sowing, and, by the aid of a little artificial heat, even in winter. There is an esteemed variety with curled leaves. Like most of the other plants of similar pungent taste, particularly those of the order *Cruciferæ*, the garden C. is powerfully



Cress (*Lepidium Sativum*): *a*, silicule.

Bitter Cress (*Cardamine armara*): *a*, silique, opening.

antiscorbutic. Still more pungent, and almost like pepper in taste, is its congener, PEPPERWORTH, *Dittander*, or *Poor Man's Pepper* (*L. latifolium*), found in wet places near the sea in some parts of Britain, and occasionally used as a condiment by the poorer classes. It was once in high repute as a remedy for various diseases. VIRGINIAN C. (*L. Virginicum*) resembles the garden C. in its properties, and is eaten as a salad, and is used as a diaphoretic medicine in North America and the West Indies. *L. piscidium*, a native of the South Sea Islands, is there used to stupefy fish; it is also one of the plants used by sailors for prevention or cure of scurvy. The name WINTER C. is given to species of the genus *Barbarea*, also cruciferous biennial or perennial plants, with racemes of yellow flowers, quadrangular pods, and lyrate or pinnate leaves. The Common Winter C. (*B. vulgaris*), formerl yknown as Herb St. Barbara, is plentiful in moist pastures and hedge-banks in Britain, and throughout Europe and North America. It is occasionally cultivated as winter salad; in Sweden it is used as a boiled vegetable. Its pungency is combined with some degree of bitterness. A double variety is common in flower-borders, and bears the name of YELLOW ROCKET. Very similar to this, and also oc-

casionaly cultivated, is the Early Winter C., or AMERICAN C. (*Barbarea præcox*), a native also of Britain, the continent of Europe, and North America.

BITTER C. (*Cardamine*) is another cruciferous genus, with linear pods, and flowers sometimes of considerable beauty, as in the common Bitter C. or Cuckoo-flower (*C. pratensis*), also known by the name of Lady's Smock—a very common ornament of moist meadows in Britain, with white, bluish-colored, or light purple flowers; the flowers of which are stimulant and diaphoretic, and had at one time a high reputation for the cure of epilepsy, particularly in children, and still retain a place in the pharmacopœias.

Water-Cress (*Nasturtium officinale*).

The young leaves of this species, as well as of *C. amara*, a species with still more beautiful flowers, and *C. hirsuta*, a small flowered species, both British, are used as salads, but more generally in some continental countries than in Britain, being pungent with a little bitterness. The leaves of *C. amara* are brought to market in large quantities in Bohemia and Saxony. The juice of *C. pratensis* is much used as an anti-scorbutic in the north of Europe, to counteract the effect of the constant use of salted meat and salted fish. WATER C. (*Nasturtium officinale*) is a perennial aquatic cruciferous plant, much used both in England and on the continent of Europe as a spring salad. The genus *Nasturtium*, which contains a considerable number of species, has a spreading calyx, and a nearly cylindrical pod. *N. officinale* is a native of almost all parts of the world. The leaves have a pungent bitterish taste, with a little saltness. They possess medicinal properties similar to those of SCURVY-GRASS. In favorable weather, they may be procured in winter as well as in spring, and may be frequently cut over during the season. The plant is cultivated to a considerable extent both in Germany and near London, in wide ditches, which are filled with slowly flowing and pure water. It grows best in clear shallow running water, with a bottom of sand or gravel. Mud is injurious both to its growth and to the flavor of its leaves. For INDIAN CRESS, see TROPÆOLUM.

CRESSET (Fr. *croisette*, diminutive of *croix*, cross), a name given to a great light on a beacon or watch-tower, to a lamp or torch, or a light fixed on a pole. The name owes its origin to the fact that formerly beacons were usually surmounted by a cross.

CREST (Lat. *crista*, a tuft, from *cresco*, to grow up). Though popularly regarded as the most important feature in heraldic emblems, the C., in the eyes of heralds, is an external adjunct to the shield, without which the bearing is complete, and which may consequently be altered without materially affecting its significance. Occupying the highest place on the helmet (see illustration), it is the member of the bearing by which the knight was commonly known in battle; and from this circumstance, it is to it that the term *cognizance* (from *cognosco*, to know) is properly given. Its claim to a classical origin is probably better than that of any other portion of coat armor. Jupiter Ammon is represented as having borne a ram's head on his helmet, and Mars the figure of a lion or a tiger. Alexander the Great, on the pretence that he was sprung from Jupiter, assumed the ram's head; and Julius Cæsar bore a star, to denote that he was descended from Venus. The helmet, as we see it represented on ancient statues and gems, was frequently adorned with a crest. Sometimes it was of horse-hair; at other times a lion or other animal was placed on the helmet, either erect or couchant.

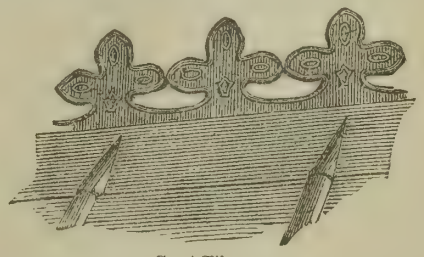
Helmet and Crest of Roger de Quincy, Earl of Winchester.

Newton, in his *Display of Heraldry*, says that the first C. to be met with it in the monuments of English chivalry, is that on the great seal of Richard Cœur de Lion. The helmets in this instance, and in that of Roger de Quincy, Earl of Winchester, differ in form from those afterwards used, the C. occupying a much larger space. Crests are said to have come into general use about the time of Henry III., and to have been used as marks of distinction by commanders in the holy wars, as they had formerly been by the Roman centurions. For lightness they were often made of stuffed leather, which was gilt, silvered over, or painted—a circumstance which explains their greater size then than in later times, when they were made either of wood or metal. The earliest example of the wreath on which the C. is now invariably placed, is that on the monument of Sir John Harsick. It consisted of two pieces of silk, of the colors of the armorial bearings of the wearer, twisted together by the lady who had chosen him for her knight. Though crests are now invariable appendages to shields, and many of them are appropriated to particular families by hereditary descent, they are believed to have been originally assumed at the pleasure of the wearers; and they are even now less strictly under the cognizance of the heralds than the devices on the shield, which must always be assigned by competent authority. Crests are so various that a classification of them is scarcely possible.

The following is an abridgment of that given by Newton, who has written very fully on the subject in his *Display of Heraldry*. The most ancient class of crests he believes to have consisted of ferocious animals, which were regarded as figuratively representing the bearer and his pursuits. Secondly, they were devices assumed as memorials of feats of chivalry, and for the purpose of perpetuating traditions and family legends, either in addition to, or differing from, those represented on the shield. Thirdly, they served only to give a more prominent place to objects already represented on the shield. Fourthly, they commemorated religious vows, or expressed the religious or knightly aspirations of the bearer. Fifthly, they were mere whims, and were adopted for no very definite reason, and served no very definite purpose. As many of them belonged to persons not only unconnected by family, but of different names, they no longer served the purpose of distinction when separated from the shield. To this latter class belong the vast majority of modern crests assumed at the suggestion of seal-engravers and coach-painters.

The lion assumed by Richard I., during the crusade in the Holy Land, to express the bravery for which he was proverbial, was borne by Edward III., Henry VII., Edward VI., and James I.; and since that time has been recognized as the appropriate C. of the royal family of England. In early times, the same C. was not always borne even by the same person. Besides the lion, Edward III. occasionally bore a white raven crowned; and other monarchs made use of similar additions. Anciently, the nobility mostly bore plumes of feathers. But several of the Earls of Warwick, of the Beauchamp family—the last of whom died in 1445—bore for C. a bear with a rugged staff, muzzled, collared, and chained, as it is still to be seen on signs (see woodcut). The origin of the wreath has been already mentioned. It is now represented as consisting of two stripes of gold or silver lace, twisted into a circular cord. Its tinctures are always those of the principal metal and color of the arms. It is a rule in delineating the wreath, which is shown edgewise above the shield, that the first coil shall be of metal, and the second of color. Civic, triumphal, and other crowns were used as wreaths; and this practice is supposed to have given rise to the use of coronets, out of which crests are sometimes represented as issuing, even in the case of persons who are not noble.

CRESTE, in Architecture, an ornamental finishing, either carved in stone, or of tiles running along the top of a wall, or the ridge of a roof. *Crest-tiles*, or, as they are corruptly called, Cress-tiles,



Crest-Tiles.

or Crease-tiles, are frequently in the form either of small battlements or Tudor flowers, as in the accompanying illustration from Exeter Cathedral. See COPS.

CRESTED, in Heraldry. When a cock or other bird had its comb of a different tincture from its body, it is said to be C. of such a tincture, naming the tincture.

CRE'SWICK, THOMAS, R.A., one of the best and most popular of recent English landscape-painters, was born at Sheffield, 1811. He early exhibited a taste for drawing, and in his 17th year removed to London, with a view to study the art as a profession. But already he had so far advanced, that two of his pictures were, during that year, admitted into the Royal Academy's exhibition. C. loved to paint the beautiful streams, and glens, and wooded dells of his native land; and these, which form the subject of his best paintings, are represented on his canvas with the very fidelity and freshness of nature itself. Among his greatest works are

'England,' 'London Road a Hundred Years Ago,' and the 'Weald of Kent.' His knowledge of aërial perspective was unsurpassed. C. also painted some admirable sea-side studies. He was elected an associate of the Royal Academy in 1842, and R.A. in 1851. C. was one of the artists to whom the arrangement of the Gallery of Modern Paintings at the Manchester Exhibition of 1857 was intrusted. He died in 1869.

CRETA'CEOUS GROUP, or CHALK FORMATION, the upper strata of the Secondary series, immediately below the Tertiary beds, and resting on the Oolite. This group is separated from the Eocene Tertiary beds by a decided change in both the rocks and fossils. The Eocene strata rest unconformably upon the chalk; it is, however, more than probable that a number of beds may yet be discovered to fill up the gap which apparently here exists in the sequence of the rocks.

The C. G. covers a large extent of surface in Europe and the east of Asia; beds of the period have also been noticed in North and South America. The typical strata occur in the south-east of England, and are connected with similar beds in the North of France and Germany, and in Denmark. Indeed, the bed of the German Ocean seems to be composed of rocks of this group, as is evidenced by the masses of chalk and flint thrown on the shores of Scotland after storms.

The strata of the group have been arranged in the following order. The maximum thickness of the divisions is given in feet.

		Feet.
Upper	1. Maestricht	100
	2. Chalk with Flints	500
	3. Chalk without Flints	600
	4. Chalk Marl	100
	5. Upper Greensand	100
Lower	6. Gault	150
	7. Lower Greensand	850
	8. Wealden beds	1300

1. The Maestricht beds (q. v.) consist of pisolitic limestones in the north of France, and of loose yellowish sandstones in Holland. 2. The chalk with flints is a great mass of pure white pulverulent limestone, usually too soft for a building-stone, but sometimes passing into a more solid state. It occurs in beds of great thickness, with the stratification often obscure, except when rendered distinct by interstratified layers of flint a few inches in thickness, occasionally in continuous beds, but oftener in nodules, and recurring at intervals from two to four feet distant from each other. Iron pyrites is found frequently in these beds in radiated nodules; it readily decomposes, and produces rusty stains on the rock. 3. Chalk without flints; this differs from the upper chalk only in the want of flints. 4. Chalk Marl; the white chalk, by the gradual admixture of argillaceous matter, becomes hardened, until it passes into a pale buff-colored marl, or argillaceous limestone, sometimes of sufficient compactness to be used as a building-stone. 5. Upper Greensand (see GREENSAND), composed of alternating layers of sands, clays, and limestones, occasionally, but not always, colored with green particles of a chloritic mineral. 6. Gault (q. v.), a stiff dark clay, used for brickmaking, with many beautifully preserved shells. 7. Lower Greensand (q. v.), so like petralogically to the Upper Greensand, that when the intervening Gault is absent, it is impossible to separate them, except by their organic contents. The Specton Clay, a local Yorkshire bed of dark clay, is of the same age. 8. Wealden (q. v.), divided into the two groups, the Wealden clay and Hastings sand, consists of a great series of shales and sandstones, with scattered beds of lime and ironstone.

The most remarkable petralogical characteristic of the group is the chalk, which exists in such abundance as to have given its name to the formation (Lat. *creta*, chalk). It is a white, soft, and pulverulent limestone, consisting almost entirely of carbonate of lime; the only foreign matter in any quantity being silex, which is aggregated together in an amorphous condition, in nodules or layers of flint. Occasional pebbles are also found, but they are extremely rare. Chalk was formerly supposed to be a chemical precipitate: the microscope has, however, shown it to be composed of minute shells mixed with the broken fragments of larger ones; and, very recently, the use of an improved deep-sea sounding apparatus has revealed a sediment now accumulating in many places, which agrees in every point, save solidity, with the chalk. When a piece of white chalk is rubbed down to powder with water, by means of a soft brush, and the powder examined by the microscope, it will be found that the greater portion consists of shells of the minuter kinds of Foraminifera, mixed with the disintegrated prisms of Pinna or other large shells of like structure, the shells of Cytherina, a marine Entomostracan, and probably a few Diatoms. Deep-sea soundings have disclosed a formation precisely similar, as taking place at the present time. Of some gatherings obtained at a depth of two miles from the great Atlantic plateau, Professor Bailey says: 'I was greatly delighted to find that *all* these deep soundings are filled with microscopic shells; not a particle of sand or gravel exists in them. They are chiefly made up of perfect little calcareous shells (Foraminifera), and contain also a small number of siliceous cells (Diatomaceæ).' The occurrence of pebbles in the chalk can easily be accounted for, if we suppose them to have been floated in, attached to the roots of trees, or more probably to sea-weeds. It is more difficult to account for the origin of the flint. Professor Bailey found that some seas, especially in the Arctic regions, supplied an enormous quantity of the siliceous frustules of the Diatomaceæ, and spicules of sponges. That such organisms may have been converted into the flint nodules seems very probable, when we remember that many of the nodules have the external conformation of sponges, and show occasionally also the internal structure. Mr. Bowerbank's microscopic examination of flint nodules, seems to lead to the conclusion that all flints are produced from the siliceous skeletons of organic beings. Chalk, then, seems to have been a deposit in very deep seas, far out of the reach of land-currents, which would certainly have brought with them argillaceous and arenaceous debris.

The C. G. is highly fossiliferous. The remains of plants are abundant in the fresh-water Wealden beds; amongst them have been found fragmentary portions of dicotyledons. If we except the microscopic Diatomaceæ, which are not unfrequent in the white chalk, vegetable remains are rare in the other members of the group. The various divisions of the animal kingdom are represented in the organic remains of the chalk, if we except the warm-blooded vertebrata, which have hitherto—if they existed—escaped notice. Foraminifera were enormously abundant in the seas, and active in the secretion of the soluble carbonate of lime, fixing it in their minute shells, which, after their death, as has been shown, formed the principal material of the chalk. In the lower beds, Polyzoa have been found in great abundance on the continent. Echinoderms are in immense numbers, and beautifully preserved. Crustacea are occasionally found. Of mollusca, the Brachiopoda and Cephalopoda are especially abundant, both being pelagic types. Ctenoid and Cycloid fishes appear in this group for the first time, though yet in small numbers—the Placoids and Ganoids being still the predominant forms. Reptiles, though not so numerous as in the former period, were yet far from rare. For further details of the fossils, see DIATOMACEÆ, VENTRICULITES, FORAMINIFERA, TEREBRATULA, RHYNCHONELLA, HIPPURITES, AMMONITES, PTYCHODUS, MOSOSAURUS, PLESIOSAURUS, ICHTHYOSAURUS, PTERODACTYL, &c.

CRETE. See CANDIA.

CRE'TINISM, from *crétin* (French), an idiot of the Alps, and this again probably from *chrétien*, a Christian, one who, from his state of fatuity, could not sin, and was viewed with some degree of religious respect. The name of C. is now applied in a more general sense to idiocy, or defective mental development depending upon local causes, and associated with bodily deformity or arrested growth. C. is very often found in connection with Goitre (q. v.), in the lower Alpine valleys, not only of Switzerland and Italy, but of the Pyrenees, Syria, India, and China. In Europe, it is rarely met with at a higher elevation than 3000 feet, and haunts chiefly the valleys surrounded by high and steep walls of rock, which exclude the light, and limit the free circulation of air. Cretins are always pitiable, and frequently repulsive objects; they are generally dirty, shameless, and obscene; their appetite is commonly voracious; the mouth is large and open, the tongue often protruded, the eyes small, the nose flat and broad, the skull narrow and small in all its dimensions, the forehead retreating, the complexion cadaverous; in addition to which, the whole body is dwarfish, the hands and feet large, the limbs often rickety, the belly protuberant.

The cause of C. is still imperfectly understood; the recent researches of Virchow tend to the conclusion that it is a physical degeneration, dependent on the reception of an undue amount of calcareous matter into the system; and this agrees with the general result of numerous observations previously made, as to the prevalence of goitre and C. in places where calcareous waters are alone accessible to the inhabitant. See GOITRE. Many attempts have been recently made to improve the condition of the cretin in childhood, by removing him from the locality of his birth, and by careful training; the institution founded by Dr. Guggenbühl on the Abendberg (q. v.), near Interlaken in Switzerland, having been the prototype of many others on the continent, and of some in England and Scotland, for the education of idiots.

CREUSE, a river and a department in the center of France. The river rises in the mountains on the southern border of the department of C., and flows in a generally north-north-west direction through that department, then in a north and westerly direction through Indre, and dividing the departments Vienne and Indre-Loire, falls into the Vienne, a tributary of the Loire, about 12 miles north of Chatellerault, after a course of about 150 miles.—The department to which the river gives its name lies in lat. 45° 39′—46° 26′ N., and long. 1° 24′—2° 36′ E. On an area of about 2200 square

miles, it had a population, in 1872, of 247,663; at the census of 1881, the pop. was 268,131. Low mountains and chains of hills occupy the greater part of the land. The streams, with the exception of the C., are insignificant. The climate is moist and variable, and the soil thin and light in the southern hilly district, which is interspersed with stretches of heath and pasture, but better in the lowlands of the north-east. The products are rye, buckwheat, oats, and potatoes; but agriculture is backward, and the rearing of cattle forms the chief branch of rural industry. Large quantities of chesnuts and fruit are grown. The minerals are not important. The people of C. are but slightly educated, and use a coarse patois; but are generally industrious, and annually migrate in large numbers to find work in various parts of France. C. is divided into the arrondissements Aubusson, Bourganeuf, Boussac, Guéret, with Guéret for its capital.

CREUZER, Georg Friedrich, a learned German philologer, was born at Marburg, March 10, 1771, and studied there and at Jena. In 1802, he was appointed a professor at Marburg, and in 1804 obtained the chair of Philology and Ancient History at Heidelberg, which he occupied for 44 years in the worthiest manner. In 1848, he retired into private life, the infirmities of age having forced him to renounce the fatigue of teaching. He died at Heidelberg, 15th February 1858.

C.'s whole life was devoted to the study of antiquity. His first, and probably his greatest work, was *Symbolik und Mythologie der alten Völker, besonders der Griechen* (4 vols., Leip. 1810—1812). This treatise, which asserted the symbolical character of ancient mythologies, excited a lively controversy, in which Hermann and Voss appeared as the opponents of Creuzer. His next work in importance was a complete edition of the works of Plotinus (3 vols., Oxford, 1835). Along with G. H. Moser, C. edited several works of Cicero—*De Natura Deorum* (1818), *De Legibus* (1824), *De Republica* (1826), and *De Divinatione* (1828), &c. Between 1837 and 1848, he published a partial collection of his writings in 10 vols. (*Deutsche Schriften*. Leip. and Darms.), the last of which contains an autobiography of C. under the title *Aus dem Leben eines Alten Professors*. He was also the writer of essays on archæological topics too numerous to be mentioned. In 1854 appeared *Friderici Creuzeri Opuscula Selecta*.

CREUZOT, Le, a town of France, dep. of Sano-et-Loire, 12 miles south-south-east of Autun. It is situated in the midst of a district rich in coal and iron, and possesses large iron foundries, which turn out cannon, anchors, steam-machinery, &c., and which employ 10,000 workmen. There is also a glass manufactory. Pop. (1841) 4000; (1876) 15,599.

CRÈVECOEUR (*Heart-breaker*), the name of a Dutch port in the province of North Brabant, on the left bank of the Meuse, where this river receives the Dieze, about 4 miles north-north-west of Boise-le-Duc. It figures somewhat prominently in the wars of the Dutch and Spaniards.

CREVILLE'NTÉ, a town of Spain in the province of Alicante, about 20 miles west-south-west of the city of that name. It is situated at the foot of the hills forming the boundary of Murcia, and has a population of about 8000, who are chiefly engaged in weaving and in agricultural pursuits.

CREW, of a ship, is a collective name for all the persons employed therein, but usually limited to designate petty officers and seamen only. In men-of-war, the entire C. are divided into five groups: 1. Commissioned and warrant officers; 2. Chief petty officers; 3. First-class working petty officers; 4. Second-class working petty officers; 5. Able seamen, ordinary seamen, landsmen, and boys. In the very largest war-steamers now afloat, there are upwards of 152 different ranks, grades, or offices among the crew, excluding officers and marines.

In a merchant-ship, under the new Mercantile Marine Act, the master, before he starts on a voyage, must send a list of his C. to the customs' comptroller at the port of departure, and a similar list within forty-eight hours after his return. The masters of coasting vessels, however, are required to do this only twice a year. Emigrant officers insist that ships to Australia shall have four seamen as C. to every 100 tons burden, and three to ships bound for America. In the large sea-going steamers, however, the number of hands is relatively greater, owing to the various duties relating to the machinery; a steamer of 1000 tons will have as many as 60 or 70 hands, if bound for a long voyage.

CREWE, a town in the south of Cheshire, forming a central station of five important railways, to which it owes its present importance. Pop. (1871) 17,810; (1881) 24,372, chiefly employed in the railway stations, and in the manufacturing of railway carriages and locomotives. About the year 1840 there were only two or three houses where Crewe now stands. The London and North-Western Railway Company have erected a handsome church, and a large mechanics' institute, containing an assembly-room.

CREW'KERNE, a town in the south-east of Somersetshire, in the fertile valley of the Parret and Isle, 10 miles south-south-west of Ilchester, and surrounded by a wide amphitheater of highly cultivated hills. Pop. (1871) 3557. The chief manufactures are sailcloth, sacking, hair-seating, webbing, and girths. Its weekly market, and annual fair, which is held on 4th September, for sheep, cattle, and horses, are much frequented and well supplied. The word C. means 'hermitage of the cross.'

CRI'BBAGE is a game with cards, played by two, three, or four persons, the whole pack being used. When three are engaged, each plays for himself; when four, they take sides; the value of the cards is the same as at whist; but there are no trumps. The number of cards dealt is usually five or six, the mode of playing the game varying slightly with the number of cards used. The points are scored on a board with holes for pegs, and 61 constitutes game. The terms used in the game are as follow: *Crib*, the cards laid out by each party, the points made by them being scored by the dealer. *Pairs* are two similar cards, as two aces or two kings; they reckon for two points, whether in hand or playing. *Pairs royal* are three similar cards, and reckon six points. *Double pairs royal* are four similar cards, and reckon twelve points. These various points are thus made: if your adversary plays a seven, and you another, a pair is made, which entitles you to two points; if he then play a third seven, he makes a pair royal, and marks six; and if you play a fourth seven, it constitutes a double pair royal, and entitles you to twelve points. *Fifteens*.—If any combination, whether of two or more cards, in your hand, or in play, make together fifteen, such as a ten and a five, a two, a five, and an eight, &c., you reckon two points. *Sequences* are three, four, or more successive cards, and reckon for an equal number of points; and in playing a sequence, it is of no consequence which card is played first; for instance, if your adversary plays an ace, and you a five, he a three, you a two, and he a four, he scores five for the sequence. *Flush* is when the cards are all of one suit, and reckons for as many points as there are cards. A knave of the same suit as the turn-up card counts for one in any hand. If a knave be turned up, it counts two for the dealer. For full directions for playing the game, see *Chambers's Information for the People*, article 'Indoor Amusements.'

CRI'B-BITING is a bad habit met with especially in the lighter breeds of horses, and those spending a considerable amount of leisure in the stable. The act consists in the animal seizing with his teeth the manger, rack, or any other such object, and taking in at the same time a deep inspiration, technically called *wind-sucking*. C. springs often from idle play, may be first indulged in during grooming, especially if the operation is conducted in the stall, and the animal be needlessly teased or tickled; is occasionally learned apparently, by imitation from a neighbor; and in the first instance is frequently a symptom of some form of indigestion. Its indulgence may be suspected where the outer margins of the front teeth are worn and rugged, and will soon be proved by turning the animal loose where he can find suitable objects to lay hold of. It usually interferes with thriving and condition, and leads to attacks of indigestion. It can be prevented only by the use of a muzzle or throat-strap; but in those newly acquired cases resulting from gastric derangement, means must further be taken to remove the acidity or other such disorder.

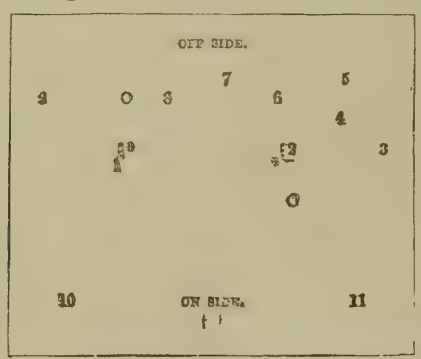
CRICE'TUS. See Hamster.

CRI'CHTON, James, surnamed the 'Admirable,' was a native of Scotland, where he was born in 1551, or, according to others in 1560. His father, Robert Crichton of Elliock, in the county of Perth, was Lord Advocate of Scotland from 1561 to 1573. On the mother's side, C. was descended from the old Scottish kings, a circumstance of which he used to boast on the continent. He was educated at St. Andrews University. Before he reached his 20th year, he had, it seems, 'run through the whole circle of the sciences, mastered ten different languages, and perfected himself in every knightly accomplishment. Thus panoplied in a suit of intellectual armor, C. rode out into the world of letters, and challenged all and sundry to a learned encounter. If we can believe his biographers, the stripling left every adversary who entered the lists against him *hors de combat*. At Paris, Rome, Venice, Padua, Mantua, he achieved the most extraordinary victories in disputation on all branches of human knowledge, and excited universal amazement and applause. The beauty of his person and the elegance of his manners also made him a great favorite with the fair; while, as if to leave no excellence unattained, he vanquished, in a duel, the most famous gladiator in Europe. The Duke of Mantua, in whose city this perilous feat was performed, appointed him preceptor to his son, Vincentio di Gonzago, a dissolute and profligate youth. One night, during the carnival, C. was attacked in the streets of Mantua by half-a-dozen people in masks. He pushed them so hard that their leader pulled off his mask, and disclosed the features of the prince. With an excess of loyalty which proved his

death, C. threw himself upon his knees, and begged Vincentio's pardon, at the same time presenting him with his sword. The heartless wretch plunged it into the body of his tutor. Thus perished, in the 22d year of his age, the 'Admirable Crichton.'

What measure of truth there may be in the hyperbolical eulogies of his biographers, it is impossible to determine, as C. left no writings by which they might have been judged.

CRI'CKET (of doubtful derivation), a well-known game, is of very ancient date. The author of the *Cricket Field*—one of the best manuals on the subject—believes it to be identical with 'Club-ball,' a game played in the 14th c.; it went originally by the name of 'handyn and handoute.' C. is a truly national English game. There is hardly a town, village, or school, that does not own its C. ground, and military authorities hold it in such estimation as a healthy recreation, that soldiers are encouraged to occupy their leisure time in its pursuit. Of late years, C. has been introduced largely into Scotland and Ireland, and is rapidly becoming naturalized all over the world. The requirements for carrying on the game are—1st, a piece of level turf an acre or two in extent; 2d, a sufficient number of players to form two sides of eleven each, for *double* wicket, and a lesser number for *single* wicket; 3d, for double wicket (the mode in which the game is usually played), two bats, two sets of wickets and bails, and a ball. When a match is to be played between two 'elevens,' the first thing to be done is to 'pitch' the wickets. *Wickets* consist of six wooden stumps, 27 inches high, and are placed in the ground in sets of three, at a distance of 22 yards apart. On the top of each set of stumps are placed two small pieces of wood, called *bails*. The rival sides next toss for first 'innings,' and the director of the side that is to go in first, places two of his men at the wickets as batters; while a bowler, wicket-keeper, long stop, and fielders (see accompanying illustration), are placed in their several positions by the director of the opposite side. When these arrangements are satisfactorily made, and the markers or scorers are at their post, the umpires take their places, and the game begins. It may be well to mention here that the relative merits of rival sides are decided by the total number of *runs* made by each eleven batters during two innings—the side whose players score the most being, of course, victorious.



Plan of Cricket-field, showing positions of parties engaged at double wicket:

Names of parties indicated by the figures: **, Batters; 1, Bowler; 2, Wicket-keeper; 3, Long-stop; 4, Short-slip; 5, Long-slip; 6, Point; 7, Cover-point; 8, Mid-wicket; 9, Long Field-off; 10, Long Field-on; 11, Leg; OO, Umpires; ††, Scorers. This is the usual placing of the field-men, but bowlers make such alterations as they deem best to oppose the batters.

We may further premise that the bowler's object is to direct his ball, by a swift movement of the arm, towards the opposite wickets, at which one of the batsmen stands, and, if possible, to strike down the stumps or knock off the bails; while the object of the batsman, on the other hand, is to protect his wickets from the bowler's attack, by either stopping the ball when it reaches him (blocking), or driving it out to the field. And much of the beauty of the game depends upon the precision with which the bowler can direct ball after ball in a straight line for the wickets, and the corresponding skill displayed by a good batsman in guarding them.

We will now suppose the two batsmen to be at their places, the bowler at his, ball in hand, and the other players arranged in theirs: at a signal from the umpire, the bowler cries 'Play!' and immediately after, *delivers* his first ball. If the batsman misses the ball, and it passes the wicket, the wicket-keeper stops it, and returns it to the bowler, who delivers another ball, and so on. When the batsman strikes the ball fieldwards, he immediately runs to the opposite wicket, passing his companion batsman, who crosses to his, and so on, till the ball has been returned by a fielder to the wicket-keeper or bowler's hand. Thus, if the stroke be a long one, the striker may have time to run perhaps three times between the wickets before the ball is thrown up, when three 'runs' are accordingly placed at his name by the scorers, on their sheet. If, however, the bowler or wicket-keeper receives the ball, and touches the wickets with it, before the advancing batsman has reached his 'ground' or touches it with his bat, the striker is out, and another man takes his place. Besides, if a ball from a stroke of the bat be caught by one of the opposite party before it reaches the ground; or if in striking at a ball the striker hits down his wicket; or if he wilfully prevents a ball being caught, or strikes it twice; or if any part of his person stops a ball which would otherwise have hit his wicket, the striker is out. It frequently happens that two skilful batsmen guard their wickets so effectually, and score so many runs, to one particular style of bowling, that a change either of the bowler, or style of bowling, is adopted by the other side. This change, say from swift to slow bowling, or *vice versâ*, generally produces the required results, and leads to the speedy retirement of the hitherto fortunate batsmen.

The wicket-keeper's place is a very important one, his principal duty being to stop with his hands every ball the batsman misses, it being allowable to make runs (byes) for balls that elude his grasp. Behind him stands the long stop, who is always on the outlook for balls that escape the wicket-keeper.

The fielders, who are posted in various parts of the ground, ought to possess quickness of eye and foot, and skill in picking up with either hand a ball that is running, and instantly throwing it to the wickets. They must also be well skilled in catching balls. Much depends on their judgment of distance between the point at which the ball is picked up, and the wickets, as misconception of this may lead to overthrowing the ball, or throwing it short, while the batsmen are profiting by the error, and scoring additional runs. Fielders usually throw the ball to the wicket-keeper, who returns it slowly to the bowler; this saves the hands of the latter from being unsteadied by catching long balls.

At the end of every four bowls, the bowler, wicket-keeper, long-stop, and fielders, change places, and thus every four balls are delivered from alternate wickets; four balls constitute an 'over,' which it is the umpire's duty to reckon and announce.

We have said that each side is allowed *two* innings, but it sometimes happens that one side scores more runs in one innings than the other does in two; thus, A's side, we will suppose, goes in first, and its eleven men score 180; B's side then goes in, and scores, say, 80 the first innings, and 70 the next; in that case, A would be said to have won by an innings and 30 runs.

In England, there are many professional men who make a livelihood by playing matches with amateur clubs, and by instructing the latter in the art. The Marylebone Club is the parliament of cricket, and its laws are recognized as the only genuine code all over the world; and for skill and science, the 'Eleven of all England,' and the 'United Eleven' (professionals), excel all other cricketers in the world. The attractions of C. are rapidly spreading. In America and Australia, the game is played with zeal and skill. English elevens have crossed the ocean more than once to compete with American and Australian clubs; and an Australian eleven won almost all its matches against many of the best English clubs in 1882. Good works on C. are *The Cricket Field*, *Felix on the Bat*, Lillywhite's *Guide to Cricketers*, Captain Crawley's *Cricket* (1878). See also *Cricket Scores and Biographies*.

CRICKET (*Gryllus*; *Acheta* of some naturalists), a genus of orthopterous insects, of the section *Saltatoria* (in which the hinder legs are long, very strong, and formed for leaping), allied to locusts and grasshoppers, and the type of a family *Gryllidæ* (or *Achetidæ*). The wings are folded horizontally, and form, when closed, a slender thread-like acumination beyond the wing-covers. It is supposed to be by friction of the wing-covers against each other, and from a peculiarity of their structure, that the males produce the stridulous sound which makes these insects so well known. The antennæ are long and thread-like, inserted between the eyes. The best known species is the HOUSE C. (*G. domesticus*), which is about an inch long, with antennæ of almost an inch and a half, of a pale-yellowish color, mingled with brown.

It is widely distributed over Europe, particularly the south, and is common in Great Britain. Its very frequent abode is in nooks and crevices of houses, and it sometimes burrows in the mortar; the neighborhood of the fire is very attractive to it, particularly in winter; and its merry note has, accordingly, become associated with ideas of domestic comfort and cheerfulness. Without the heat of the fire, it becomes dormant, or nearly so, in winter. It remains quiet during the day, but is lively and active at night, issuing forth to seek its food, which consists both of animal and vegetable substances. Bread-crumbs are very acceptable to it; and for the sake, apparently, both of food and warmth, it very much frequents bakehouses. The larvæ are wingless, the pupæ have mere rudimentary wings.—The FIELD C. (*G. campestris*) is larger, blackish, with the base of the wing-covers yellowish, feeds on herbs and roots, makes a louder noise than the House C., and is not unfrequent in some parts of England, but very rare in

Scotland.—A species of C. (*G. megacephalus*) found in Sicily, makes a noise loud enough to be heard at the distance of a mile.

House Cricket (*Gryllus domesticus*):
a, eggs; *b*, young just hatched; *c*, full-grown larva: *d*, pupa; *e*, perfect insect.

—The Mole C. (*Gryllotalpa*) will be noticed in a separate article.

CRI'CKLADE, an agricultural town and parliamentary borough, in the north of Wiltshire, 7 miles south-east of Cirencester, on the right bank of the Isis. The town of C. consists of one street. The government is in a high-bailiff, appointed by the town. It has a considerable retail trade; and the market for fat cattle, held on the third Thursday of each month, is well attended. The parliamentary borough called C. includes, besides its own two parishes of St. Mary and St. Sampson, nearly 50 other parishes, or parts of parishes comprising a large and rich agricultural district, which returns two members to the House of Commons. Pop. of parl. borough (1881) 51956; of the town 7000.

CRIEFF—including the burgh of barony of Crieff and the burgh of regality of Drummond—a town on the Earn, 17 miles west of Perth. It is beautifully situated at the foot of the Grampians, near the entrance to the Highlands. Pop. (1881) 4469. It has woollen manufactures, besides tanneries. The climate of C. makes it the resort of invalids, in summer, and there is a superior hydropathic establishment, with accommodation for 200 visitors. It is eminent for its schools. St. Margaret's College was opened here in 1849, for the education of young ladies of the Episcopal communion. Near is the fine scenery of Glen Almond, with Trinity College, opened in 1847, for Scottish Episcopal students. Morrison's Academy—built at a cost of £6500, and endowed by Thomas Morrison, builder, Edinburgh, with £20,000—was opened in 1860. C. is the terminus of two branches of the Caledonian Railway, and since the opening of the first in 1856 it has much improved. The greatest Scotch cattle-market stood here till 1770, when it was removed to Falkirk.

CRILLON, Louis de Berton des Balbes, surnamed 'Le Brave,' was born at Murs in Provence, in 1541. Under Francis of Lorraine, Duke of Guise, then the model of military chivalry, he was trained for war, and at the age of 16, was accounted an accomplished soldier. In 1558, he gave the first public proof of his valor at the siege of Calais. Shortly after, he covered himself with glory at the capture of Guines. The whole army celebrated the praises of the young hero, who was introduced by Duke Francis in flattering terms to Henry II. As a reward of his numerous heroic deeds, he obtained a multitude of church benefices, which he intrusted to the care of learned clerks. In the religious wars of the 16th c., he fought against the Huguenots, and distinguished himself at the battles of Dreux, Jarnac, and Moncontour. He was likewise present at the battle of Lepanto, in 1571, and though wounded, was appointed to carry the news of the victory to the pope and the French king. In the atrocities of the St. Bartholomew Massacre, C. had no part. In 1573, he took part in the siege of La Rochelle. In 1585, Henry III. made him knight of his Orders. He continued faithful to his sovereign in his struggle with the Catholic League. Henry IV. found in him a sincere friend and adviser. After the peace with Savoy, C. retired to Avignon, and, after the fashion of a true Catholic warrior, ended his days 'in the exercises of piety and penance,' December 2, 1615. The martial fire burned brightly in C., however, even in his last days; in proof of which, there is recorded the rather melodramatic story, that when listening at church one day to an account of the crucifixion, the old hero forgot himself, and brandishing his sword, cried out: 'Où étais tu, Crillon?' (Where wert thou, Crillon?)

CRIME, in its legal, as opposed to its moral or ethical sense, is an act done in violation of those duties for the breach of which the law has provided that the offender, in addition to repairing, if it be possible, the injury done to the individual, shall make satisfaction to the community. A private wrong, or civil injury, on the other hand, is an infringement on the rights of an individual merely, for which compensation to him is held, in law, to be a complete atonement. From this definition, which is that generally adopted by lawyers (Stephen's *Com.* iv. p. 77), it is obvious that legal criminality is not a permanent characteristic attaching to an action, but one fixed upon it arbitrarily, from considerations of expediency. Without changing its moral character, the same action may, and very often is, a C. in one country or in one generation, and no crime in another country or a succeeding generation. Malice, or evil intention, however, is in all cases essential to the character of C., for though there may be an immoral act which it is inexpedient to punish as a C., it can never be expedient to punish as a C. what is not an immoral act. But it is not necessary that the evil intention shall have had reference to the party injured. If the offender acted in defiance of social duty, and regardless of order, a C. has been committed, though it may not have been the particular C. which he intended. For example, it is murder if A kill B by mistake for C, unless the killing of C would have been justifiable, or excusable. The law can take no cognizance of a bare intention, which has not ripened into any sort of act. How far *attempts* to commit C. are punishable, is always a question of difficulty. The general rule seems to be, that if such acts can be unequivocally connected with the criminal intention, they are punishable, though not to the same extent as the completed crime. Pupils under seven years of age, and insane persons, as being incapable of design or intention, are regarded in the eye of the law as incapable of C.; but questions as to the responsibility of persons laboring under partial insanity are often surrounded with practical difficulties, which are positively insoluble. The defence of *compulsion*, or *vis major*, as it is called by lawyers, if completely established in fact, is generally sufficient in law. See Compulsion. The subjection of a servant to a master, or of a wife or child to a husband or parent, will be no defence for the commission of an act of the criminality of which the offender was aware, unless it amount to compulsion. Magistrates acting *bonâ fide*, and soldiers acting under their officers in the ordinary line of duty, are not liable to a criminal charge. Extreme want is no excuse for a C. in law, though it furnishes a ground for an application for mercy.

In the technical language of the law of England, the term *offence* has a wider signification than C., the latter including only such of the former as are punishable by *Indictment* (q. v.). Crimes are divided into *Misdemeanors* (q. v.) and *Felonies* (q. v.), the latter being a higher species of offence than the former.

CRIME'A (anciently, the Tauric Chersonese), a peninsula in the south of Russia, forming the greater part of the government of Taurida, in lat. 44° 44′—46° 5′ N., long. 32° 30′—36° 35′ E. It is united to the mainland only by the very narrow isthmus of Perekop, between the Black Sea and the Sea of Azof, and separated from the isle or peninsula of Taman, on the east, only by the narrow strait of Yenikalé. The C. is thus almost surrounded by water—on three sides, by the Black Sea, and on the fourth by the Sea of Azof; while a trench, 70 feet wide and 25 deep, across the isthmus of Perekop, cuts it off from the mainland. The C. is quadrilateral in shape, the four corners pointing to the four cardinal points in the compass; but a long narrow peninsula juts out on the east, which increases the extreme length of the territory from east to west to 190 miles, the breadth being 110 miles. The whole extent of the C. is between 8000 and 9000 square miles. The coast is very much broken and indented, particularly on the side of the Sea of Azof. The most easterly part of it is a mountainous peninsula, the seat of the ancient kingdom of Bosporus. From the Strait of Yenikalé, through this minor peninsula and along the whole southern coast, a chain of mountains extends, which may be regarded as a continuation of one of the chains proceeding from Mount Caucasus. This southern district of the C. is very rich and beautiful. The mountains rise with steep slopes from the sea, whilst spurs and secondary chains extend northward, richly wooded, and with most beautiful intermediate valleys, gradually sinking into the uniform and desolate steppe which form the northern and much greater part of the peninsula. The highest mountain is Tchatirdagh, i. e., the Tent Mountain, *Mons Trapezus* of the ancients, which rises to a height of more than 5000 feet. It is a table-mountain, and has many great and deep chasms, in some of which the ice remains unmelted all the summer. The southern district of the C. is well cultivated, and is adorned by many country-seats of the Russian emperor and nobles, with parks and gardens surpassed by none in Europe. Tartar villages, mosques, and Greek convents are to be seen in most picturesque situations amongst the woods and rocks, with many ruins of ancient fortresses. The vegetation may almost be called sub-tropical; olive groves are frequent; the vineyards yield excellent grapes, and some of them excellent wine; and even

oranges are produced. Grain of various kinds is produced abundantly, and silk, wax, and honey. Much attention is bestowed upon horses, oxen, and sheep, in which no small part of the wealth of the country consists. The northern part of the C. is in every way a contrast to the south, being little else than one waste uniform steppe, destitute of water and of wood, with a soil generally very unfit for agriculture, and with numerous salt-lakes and salt-marshes, some of which dry up in summer, and which seem to indicate that it was recently covered by the sea. The air is infected by exhalations from these marshes, and from the *Siwash* or *Putrid Sea*, which is a portion of the Sea of Azof, but is almost cut off from it by a narrow tongue of land called the Peninsula of Arabat.

In the summer and autumn, a most offensive and powerful smell arises from the stagnant water, but the evaporation is often so complete that the Siwash is left dry, and horses can cross upon the hardened ground, where at other seasons vessels may sail. The capital of the C. is Simferopol (q. v.); the old Tartar capital is Baktshi-serai (q. v.), both situated in the interior. Sebastopol (q. v.) is situated in the south-west; Kaffa and Kertch are situated in the south-east; Perekop on the isthmus to which it gives its name, in the north. The C. is now directly connected with the Russian railway system, lines diverging to the south-east coast and south-west. The small river Alma, on whose banks the first battle was fought between the Russian troops and the French and English invading army (20th Sept. 1854), falls into the Black Sea, where the picturesque southern district approaches the northern steppe.

The population of the government of Taurida is (1880) 879,000, two-thirds of whom are Tartars; the remainder are Russians, Germans, Greeks, &c. The chief features in the early history of the C. are given under the head BOSPORUS (q. v.). The Tartars conquered the territory in the 13th c., and converted it into the khanat of Krim Tartary. The Genoese under these rulers planted flourishing colonies here, which were destroyed by the Turks, who came into possession of the country in the 15th century. Russia finally subjected the C. in 1783. See RUSSIA.

CRI'MEN REPETUNDA'RUM, the crime of accepting a bribe by a judge. See BARATRY, JUDGE.

CRI'MINAL, one who has been convicted of a crime. A person indicted for a criminal offence is often called a culprit in England; and when undergoing trial in the Court of Justiciary in Scotland, he is spoken of as the panel, a word which has a different signification in England. See PANEL.

CRIMINAL CONVERSATION. See ADULTERY.

CRIMINAL COURTS. See JUSTICIARY, COURT OF.

CRIMINAL INFORMATION. See INFORMATION.

CRIMINAL LAW. See CRIME, PROSECUTION, PROSECUTOR.

CRIMP is the name given to an agent for supplying ships with seamen, just before a voyage; he receives so much per head for his trouble. This offensive name is applied to these persons, because in general they make use of untruthful representations and other unfair means to entrap sailors into service. Crimps are numerous in all large seaports, and are usually in league with publicans and prostitutes to deprive seamen of their wages. They also keep a sharp look-out for emigrants, and convey all who are simple enough to put faith in their statements to low lodging-houses in which they have an interest. The mere charge for lodging is often small, but the lodgers are cheated by provision-merchants and others who pay the C. a liberal commission on their custom. Fairly conducted, the C.'s business is no more objectionable than any other agency, and within recent years the system has been greatly improved by the operation of the 'Passengers' Act' and 'Mercantile Marine Act,' and especially by the appointment of registrars of seamen and government emigration agents.

CRI'MSON. See RED COLORS.

CRI'NAN CANAL, THE, is an artificial water-communication 9 miles long, in the west of Argyleshire, between Loch Gilp, a branch of Loch Fyne, and Loch Crinan, in the Sound of Jura, at the head of the peninsula of Cantire. It was constructed to avoid the circuitous passage of 70 miles round the Mull of Cantire, on the route from Glasgow to Inverness by the Caledonian Canal. It is 24 feet broad, and 12 deep, has 15 locks, and admits vessels of 200 tons. It was excavated in the end of last century, and cost £183,000. After a continuance of heavy rain in February 1859, the three reservoirs supplying the canal with water (the highest being 800 feet above the canal) burst, and a torrent of water rushed down the mountain-slope, washed away part of the canal banks, and filled the canal with debris and stones for upwards of a mile. Government repaired the damage at the cost of £12,000. The receipts of the canal and harbor during the year ending April 1881 were £4103—being more than £2000 less than the year's expenditure.

CRINED (Lat. *crinis*, the hair), a term in Heraldry. When the hair of a man or woman, or the mane of a horse, differs in tincture from the rest of the charge, the object is said to be *crined*, of such a metal or color.

CRI'NGLES, short pieces of rope, with each end spliced into the bolt of a sail; commonly containing an iron or brass ring or thimble. Smaller ropes are passed through them, to aid in managing the sails.

CRINOI'DEÆ (Gr. lily-like), an order or family of radiate animals of the class *Echinodermata* (q. v.), of which the recent species are few, but the fossil species so very numerous as to constitute great tracts of the dry land as it now appears. The C. have a central disc, in which is contained the digestive cavity, with two orfices, and from which arise arms or rays, five in number, but soon sub-dividing, so as at first sight to appear more numerous, and again sub-dividing into lateral appendages, either fin-like or filamentous, the disc as well as the rays and their subdivisions formed of a calcareous jointed skeleton, clothed with a fleshy integument, of which the fin-like expansions are formed, and which is thicker than in star-fishes, and contains imbedded in it the innumerable ovaries. The joints are also extremely numerous, and the subdivision of the rays often very great. The disc is composed of calcareous pieces and fleshy integument like the rays, as is also a stalk on which the whole is usually supported; the base, it is supposed, being fixed, and the disc and rays expanding like a flower. It appears probable that many of the fossil C. were permanently fixed in this manner, and this is supposed to be the case with the species of *Pentacrinus* still existing, as the *P. caput Medusæ*, or Medusa's Head of the West Indian seas; but others are fixed only when young, the disc and arms finally becoming detached from the stalk and moving freely in the sea, swimming in a manner analogous to that of the medusæ.

This interesting fact was first discovered by Mr. J. V. Thompson, who found in the sea near Cork the stalked young of the *Comatula rosacea*, a small but very beautiful species, and the only species of the C. found in the British seas. See ENCRINITES.

Encrinus.

CRI'NOLINE (Fr., from Lat. *crinis*, hair) was the name originally given by the French *modistes* to a fabric made of horse-hair, capable of great stiffness, and employed to distend women's attire; it is now applied in a general way to those structures of steel wire or hoops, by means of which women some years ago attained such overwhelming dimensions. This fashion of expansion is not new. The first name we find given to it is the *fardingale*, introduced by Queen Elizabeth. Walpole in his fancy description of her, speaks of her 'enormous ruff and vaster fardingale.' The upper part of the body was encased in a cuirass of whalebone, which was united at the waist with the equally stiff fardingale of the same material, descending to the feet, without a single fold, in the form of a great bell. Gosson mentions the fardingale in 1596, in his *Pleasant Quippes for Upstart Newfangled Gentlewomen*. In the end of

Ladies in time of Queen Elizabeth, showing how the Fardingale was worn.

the reign of James I., this fashion gradually declined, and was further tamed down by Puritan feeling in the time of Charles I. and Cromwell, till it quite disappeared. We next hear of it in 1711 as 'that startling novelty the hoop petticoat,' which differed from the fardingale in being gathered at the waist. Sir Roger de Coverley is made to say of his family pictures: 'You see, sir, my great-great-grandmother has on the new-fashioned petticoat, except that the modern is gathered at the waist; my grandmother appears as if she stood in a large drum, whereas the ladies now walk as if they were in a go-cart.' Hogarth, in his night-scene in 'Marriage à-la-Mode,' introduces on the floor a hoop of the time of George II.; and about 1744, hoops are mentioned as so extravagant, that a woman occupied the space of six men. An elongated oval form also came into fashion, raised at each side to show the high-heeled shoes, causing caricaturists to say that a lady looked like a donkey carrying its panniers. These hoops were of whalebone, with canvas over them, having capacious receptacles on each side for articles of convenience. In 1780, we find hoops of cane used, being advertised to 'out-wear the best sort of whalebone.' About the year 1796, hoops had been discarded in private life, but were still the mode at court, and never had been seen in more full-blown enormity, continuing so to the time of George IV., when they were abolished by royal command.

A collapsed Hoop.

We now come to the development of this fashion about the middle of the present century; which began with C. in its original and proper sense, first in the form of the inelegant 'bustle' in the upper part of the skirt, then the whole petticoat. Instead of the hair fabric, some used, for economy, cotton, thickly corded and starched. At length, about 1856, people were startled by the question: 'Have you heard that Miss So-and-so actually wears a hoop?' and it became apparent that the fashion of Queen Anne's time had returned upon us, only that the structure was somewhat lighter and more pliant; being usually composed of a series of horizontal small steel hoops, held together either by vertical bands, or by being sewed into a kind of petticoat. Unlike former times of hoops and fardingales, the fashion descended even to maid-servants, so that where the dining-room was small, table-maids have been known to give warning, because they could not clear the space between the table and the fire; and the newspapers were continually announcing 'Accident from Crinoline,' or 'Lady burned to Death from Crinoline.' The *Spectator* dealt out much cutting, though playful raillery on the hoops of his day, but apparently with little effect; and equally unavailing were the satires of *Punch* and other caricaturists of the 19th century against the hideous fashion of crinoline. The hoops were sometimes made with a circumference of four, and even five yards. At last, after indignation and ridicule had for years assailed the monstrosity in vain, and when people had given over speaking about it, the inflation began about 1866, without any apparent cause, to collapse; and rushing to the opposite extreme, ladies might be seen walking about as slim as if merely wrapt in a morning-gown or bathing-dress. The sole relic of this kind of an expansion now to be seen is a structure of lappets, called a pannier, projecting behind, immediately below the waist.

But women, it would seem, can never rest contented without adding, in one direction or another, to their proper dimensions; for the former crinoline was soon supplanted by great cushions or pads of frizzled hair, applied chiefly to the back of the head, and covered over by the natural hair or by artificial tresses. Such a cushion was known as a *chignon* (Fr., the neck or neck-hair.) The side tresses were swelled out by smaller rolls, called, we believe, rats and mice. This fashion was not new, but was now carried to greater extravagance than ever before, the head being sometimes rendered three times its natural size.

CRI'NUM, a genus of bulbous-rooted plants of the natural order *Amaryllideæ*, having long tubular flowers, the segments of the perianth hooked at the apex, the stamens straight and inserted into the tube, and a three-celled capsule. It contains a considerable number of species, natives of different tropical and sub-tropical countries, generally with umbels of large and beautiful flowers, some of them amongst the most admired ornaments of our hothouses. *C. amabile*, an Indian species, is much esteemed for its fragrance as well as its beauty, and flowers about four times a year. All the species require a rich open soil, plenty of room for their roots, and the frequent removal of suckers.—The bulbs of *C. Asiaticum* are powerfully emetic, and are used in some parts of the East in cases of poisoning.

CRIS-CROSS ROW. See CHRIST-CROSS ROW.

CRI'SIS (Gr. a judgment, from *krino*, I judge), a name used by the ancient physicians to denote the rapid or sudden determination of an acute disease in the direction of convalescence or of death. It was opposed in signification to lysis (*luo*, I relax), which denoted the gradual subsidence of the symptoms noticed in most chronic, and in some acute diseases. The doctrine of crises was closely bound up with that of a *materies morbi*, or material of disease in the blood, which was presumed to be undergoing changes, during the whole course of the malady, tending to an evacuation of some kind from the system in the form of a critical discharge (*apostasis* or *abscess*), which, when observed, was supposed to contain the matter of disease in a state of *coction*, and to be the direct cause of the sudden relief of the patient. Thus, according to the character and seat of the critical discharge, it was common to speak of a C. by sweating, by diarrhœa, by expectoration, by urine, by parotid swellings, &c.; and no C. was considered regular that was not attended by some symptom of this kind. Another curious doctrine associated with that of crises, was the belief in certain days as ruling the beneficient or injurious, the complete or incomplete, character of a crisis. The seventh, fourteenth, and twentieth (according to some, the twenty-first) days of the disease were regarded as eminently critical; less so, but still favorably critical, were the third, fifth, eleventh, and seventeenth; the fourth day was the *indicator* of a complete C. on the seventh; the sixth day was the *tyrant*, notorious for unfavorable crises; the second, eighth, tenth, thirteenth, and the rest were non-critical. Few physicians now attach much importance to critical days, but the doctrine of crises and of a *materies morbi*, is still taught, with various modifications, in our medical schools and text-books.

CRI'SPIN, a saint and martyr, was descended from a noble Roman family. About the middle of the 3d c., under the reign of Diocletian, he, along with his brother Crispianus, fled from Rome into Gaul, where he worked as a shoemaker in the town which is now called Soissons, and distinguished himself by his exertions for the spread of Christianity, as well as by his works of charity. According to the legend, his benevolence was so great that he even stole leather to make shoes for the poor! From this, charities done at the expense of others have been called Crispinades. In the year 287, he and his brother suffered a most cruel martyrdom. Both brothers are commemorated on the 25th October. King Crispin, as he is called, is the universally recognized patron saint of shoemakers, and is represented with dramatic effect in the ceremonial processions of the 'gentle craft.' There is an amusing but scarce book about shoemakers, entitled *Crispin Anecdotes*.

CRI'THMUM. See SAMPHIRE.

CROA'TIA, a kingdom forming part of the Austrian Empire. Along with Slavonia it forms one of the administrative divisions of the kingdom of Hungary, and their joint pop. was (1880) 1,191,845; their area, 8757 square miles. C. lies to the north-east of the Adriatic, and borders on one side with Turkey. It is traversed by low chains of mountains, in the south proceeding from the Julian Alps, and in the north from the Carnic Alps. These mountains are generally covered with forests, and the chains are separated by very fertile valleys. The principal rivers are the Save and its affluent the Culpa, the Drave and its affluent the Mur. Some of the valleys, especially in the south, are quite shut in, so that many of the streams have to make their way through subterranean channels. The climate much resembles that of the neighboring parts of Hungary, the more southern situation being counterbalanced by the greater elevation. The inhabitants are mostly of Slavonic race and language. The religion of C. is that of the Roman and Greek Churches. The Croatians are warlike, but the name *Croats* is employed to designate light-cavalry regiments in the imperial army, in which Magyars and others are mingled with true Croatians. Grain, chestnuts, wine, and gall-nuts are amongst the principal exports of Croatia. The keeping of cattle is neglected. The wood of the great forests, although much of it is admirably adapted for shipbuilding, is turned as yet to little account. The *Litorale* or coast district contains valuable marble quarries. The capital of C. is Agram (q. v.). C. with its *Litorale* and Slavonia (q. v.) formerly formed a crown-land, at the head of the administration of which was the Ban (q. v.) of Croatia.

C. was, in the earliest historic times, inhabited by the Pannonians, who were conquered by the Romans under Augustus, and the country made a province of Illyria. During the irruptions of the northern nations into the Roman empire, C. suffered a variety of vicissitudes. In 640, the Croats, Chrovats, or Horvats, migrated into it from the Carpathian Mountains, and gave it its present name. In the 14th c., having previously been in some measure incorporated with Hungary, C. was more completely united with that kingdom, and passed with it, in the beginning of the 16th c., to the Austrian House of Hapsburg. In the end of the 16th c., the Turks conquered a portion of it, now known as Turkish Croatia. The city of Fiume was declared in 1797 to be a constituent and integral part of the kingdom of Hungary; and after the termination of the French wars, Fiume remained united to Hungary till 1848. The Croatians long entertained a feeling of hostility to the Magyars, which manifested itself in 1848 and 1849 in a manner very unfavorable to the cause of the Hungarian revolution. The wise policy of Austria, however, in recognizing the

legal rights of the kingdom of Hungary, has had a good effect in allaying this feeling. See MILITARY FRONTIER.

CROCHET (a French word signifying a hook), a species of handiwork, which may be described as an extensive system of looping, by means of hooks made for the purpose. You take a hook of a size proportioned to the fineness of the cotton or wool employed, and begin by making a chain of loops. You then turn and with your hook still in the last loop, begin the double process of catching the thread through each loop of the chain, and also through that in which your hook is, and thus form another chain attached to the first, and so on. This is called simple or plain crochet. Endless varieties of patterns may be formed, and lightness and elegance attained, by twisting the thread one or more times in taking up the loop, and open work is formed by passing one or more loops. This work may be made round by beginning with a very few loops, joining the first to the last, and then proceeding to take several loops through one, and so widening on. C. has this advantage over knitting, that by drawing the last loop, and leaving it wide, there is no fear of the work running down as happens when knitting-needles slip. Shades of the same color, and varieties of colors in wool as well as in silk, are used for this work. In white cotton, C. can be made available, from large bed-quilts to delicate lace-like edgings. See numerous small books describing and giving patterns of crochet.

CRO'CODILE (*Crocodilus*), a genus of Saurian reptiles, the type of the family *Crocodilidæ;* which some naturalists have erected into a distinct order of reptiles (*Loricata*), on account of the square bony plates with which their bodies are covered, instead of the scales of the other saurians—the greater solidity of the skull—the lungs not descending into the abdomen—and the approach which they make to mammalia and birds in the structure of the heart. The heart has two auricles and two ventricles; but a mixture of arterial and venous blood takes place at some distance from the heart, so that the hinder part of the body receives an imperfectly aërated blood, which, however, is supposed to be further aërated in the surface of the peritoneum, two curious openings admitting the water, in which these animals ordinarily live, into the internal cavity of the abdomen. The *Crocodilidæ* may be described as lizard-like in form, with a great gape, indicative of their characteristic voracity, and with the tail flattened at the sides, so as to become a powerful organ of propulsion in water. The fore-feet have five toes, the hind-feet four, the three inner ones only being armed with claws: the feet are more or less webbed. Each jaw has a single row of numerous large teeth, which are conical and directed backwards; planted in distinct sockets, and becoming hollowed at the base, to admit the crowns of the new and larger teeth which are to succeed them as the animal increases in size. Small ribs are attached to the vertebræ of the neck, which give it a peculiar stiffness, and make it difficult for the animal to turn; and persons pursued by crocodiles may therefore make their escape by rapid turning. The eggs of the *Crocodilidæ* are hard, and small in comparison with the size ultimately attained by the animal itself. The females of some, if not of all the species, guard their eggs, and take care of their young; although the eggs, buried in the sand or mud, are hatched by the heat of the sun alone. The *Crocodilidæ* swallow stones, apparently to assist digestion.

Crocodile's Tooth. Showing the hollow at the base in which the summit of the new tooth is sheathed.

They prey on fishes and warm blooded animals; most of them seem to prefer food in a state of incipient putrefaction, and they are even said to hide their prey, and to return to it when it has reached this state. Some of the larger kinds do not scruple to attack man.—All the *Crocodilidæ* are large reptiles; they are found in fresh waters and estuaries in the warm parts of the world; none are found in Europe, nor, as far as is yet known, in Australia. They are divided into Gavials, Crocodiles, and Alligators (the latter including caymans).—The true Crocodiles are found both in the Old World and the New. The muzzle is not slender and elongated, as in the gavials, but oblong and flattened; the teeth are very unequal in size, the long fourth teeth of the lower jaw fitting into *notches* of the upper, not into pits, as in alligators. To this genus belongs the C. of the Nile (*C. vulgaris*), which abounds also in many other rivers of Africa. It is of a bronzed green color, speckled with brown, lighter beneath, and is sometimes 30 feet long. It often seizes human beings for its prey. In Park's *Travels*, an instance is recorded of a negro, one of his guides, who was thus seized in the Gambia, and escaped by thrusting his fingers into the crocodile's eyes. The ancient Egyptians held it sacred, and being exemptedfrom all danger on the part of man, it became more bold and troublesome. The individuals particularly selected as the objects of idolatrous worship were tamed, and took part in religious processions. *Souchis* was the name of the deified individual, the C. god.—The DOUBLE-CRESTED or INDIAN C. (*C. biporcatus*), is very abundant in many parts of Asia, in rivers and estuaries, and is also dangerous to man. The smaller marsh C. (*C. palustris*), abundant in stagnant waters in the same regions, flees from man, and often seeks to hide itself in the mud, into which it thrusts at least its snout, then remaining contented, as if in perfect safety. Crocodiles often bury themselves in the mud in droughts, and so abide till rain falls.—The names C. and Alligator are often indiscriminately used in popular language.

CRO'CKETS, in Gothic Architecture, are projecting leaves, flowers, or bunches of foliage, used to decorate the angles of spires, canopies, pinnacles, &c. The varieties of C. are innumerable, almost every kind of leaf and flower being copied for the purpose. The first illustration, from Parker, is copied from Salisbury Cathedral. The other illustration represents a C. from St. Alban's Abbey, of about 1240. C. only appear in pyramidal and curved lines, never in horizontal ones.

Fig. 1.

Fig. 2.

CRO'CUS, a genus of plants of the natural order *Iridaceæ*. The species have much general similarity, and are natives chiefly of the south of Europe and of the East. Several have been described as British, but are rather naturalized than native. Saffron (q. v.) is the produce of *C. sativus*. Some of the species are much cultivated in gardens for the beauty of their flowers, particularly those which, as *C. vernus* and *C. luteus*, flower very early in spring. The saffron C. and some other species flower in autumn. The flowers of one or two species are fragrant. It is necessary frequently to take up C. roots and plant anew on account of the manner in which the corms multiply. See CORM.

CROCUS OF ANTIMONY is the oxysulphide of Antimony (q. v.).

CROCUS OF MARS is the finely divided red oxide of iron.

CRŒ'SUS, the last king of Lydia, succeeded his father, Alyattes, in 560 B.C. He made the Greeks of Asia Minor his tributaries, and extended his kingdom eastward to the Halys. From his conquests, his mines, and the golden sand of the Pactolus, he accumulated so much treasure, that his wealth has become proverbial. He gave himself up to a life of pleasure and sumptuous extravagance, and is said to have deemed himself the happiest man in the world, and to have been displeased when Solon, on a visit to his court, told him that no man should be called happy till his death. He soon found how uncertain was a happiness such as his; for his beloved son Atys was killed while hunting, and there was left to him only one son, who was dumb; and having engaged in war with Cyrus, he was totally defeated, his kingdom conquered, and himself made prisoner, and condemned to be burnt (546). At the funeral pyre, his repeated exclamation of 'O Solon!' drew on him the attention of the conqueror, and the reason of it being known, his life was spared, and he was treated with great kindness.

CROFT (Ang.-Sax. *croft*), a small piece of land connected with a humble kind of dwelling, whose inhabitant, the renter of the land, is called a crofter. In the Highlands and islands of Scotland, where the crofting system is especially common, it is usual for the crofter to have, besides his cottage, a small patch of land for tillage; while the crofters of the township collectively, in certain proportions or 'summings,' have a right of pasturage on the adjoining hill pasture or moorland. Of late, grave complaints

have been made by the crofters, or on their behalf, that the great poverty and bad farming which admittedly prevail amongst them are due to removable and unjust causes. It is alleged that they have no leases; they have no compensation for any improvements they may make on their holdings, but on the contrary, usually have their rents capriciously raised; the land is exhausted by continual manuring with sea-weed only; townships have frequently been removed from fertile land and put on less fertile tracts in order to make large sheep runs or deer forests; the number of crofters on a given area has often been much increased in a given township or area without any corresponding reduction in rent; while eviction on short notice depends on the arbitrary decree of the landlord or the goodwill of the factor. Others affirm that the evils complained of are inseparable from the system, which is inherently bad; that the natural increase of the population leads to the excessive subdivision of crofts already too small to support a family; and that the smallness of areas to till makes the tillers fitful at work and lazy in habit. A royal commission to inquire into the crofters' grievances took evidence in 1883. Many of the crofters combine with their farming occupations, the calling of fishermen during part of the year. Cottars are still more dependent than the crofters, and occupy huts, occasionally with a small garden, at small rents or sometimes rent free. See AGRICULTURE, FARM, SPADE-HUSBANDRY.

CROIA, a town of Albania, Turkey, on a mountain spur, 45 miles S.E. of Scutari. It is the chief town of the Mirdites, a Roman Catholic tribe of Albanians, who are almost independent. Pop. 6000.

CROIX, STE. (or SANTA CRUZ), in English, *Holy Cross, Holyrood*, or *St. Cross*, an island of the Virgin group, is the principal Danish possession in the West Indies. With an area of about 100 square miles, it contains about 25,000 inhabitants, being generally cultivated like a garden.—St. C. is also the name of a river, otherwise known as the Schoodie or the Passamaquoddy, which falls into Passamaquoddy Bay, on the Bay of Fundy. It is the boundary throughout between the state of Maine and New Brunswick.

CRO'KER, JOHN WILSON, an English politician and *littérateur* of considerable notoriety, was born at Galway, in Ireland, December 20, 1780. Educated at Trinity College, Dublin, he entered Lincoln's Inn in 1800, and was called to the Irish bar. His first literary attempt was a satire on the Irish stage; and in 1805, he published another equally clever satire on the city of Dublin. In 1807, he issued a treatise on the *State of Ireland, Past and Present*, and was elected member of parliament for Downpatrick. A warm defence in parliament, in 1809, of the Duke of York, helped C. in the same year to the office of Secretary to the Admiralty, a post which he held for twenty years. He was one of the founders of the *Quarterly Review*, and contributed many of the most violent party articles to its pages, as well as a large number of those bitterly personal and grossly abusive reviews which were wont to disfigure that periodical. As 'Rigby,' allowance being made for the satire, his character is not badly hit off by Disraeli, in *Coningsby*. In parliament, C. steadily opposed the Reform Bill in all its stages, and its enactment ended his parliamentary career; but on all questions relative to the promotion of the fine arts, he was much ahead of the great majority of the Commons. He took an active part in the establishment of the Athenæum Club, and rendered good service to literature by his annotated edition of Boswell's *Johnson*, and his publication of the *Suffolk Papers*, and Lord Hervey's *Memoirs of the Court of George II.* His *Stories from the History of England for Children*, supplied Scott with the idea of *Tales of a Grandfather*. C. died August 1857.

CROKER, T. CROFTON, a popular author and collector of Irish stories and legends, was born in Cork, January 15, 1798. He early devoted himself to the collection of legends and songs of the Irish peasantry; and, in 1824, he published his *Researches in the South of Ireland*, characterized by a happy blending of humor and sentiment, with archæological learning.

This work was followed by the *Fairy Legends and Traditions of the South of Ireland* (1825); *Legends of the Lakes* (1828); *Daniel O'Rourke*, a sort of Irish Münchhausen (1828); *Barney Mahoney* (1832); *My Village* (1832); and *Popular Songs of Ireland* (1839). *Barney Mahoney* and *My Village* are the most original. C. also edited *Memoirs of Joseph Holt, General of the Irish Rebels*, a very interesting work, which was published in 1838. He devoted much time, and rendered considerable service, to archæology, being member of many antiquarian societies. Through the influence of John Wilson Croker, a friend, but no relative, he, at the age of 21, obtained a clerkship in the admiralty. He died August 8, 1854.

CROLL'S THEORY of climatic changes. See GLACIAL PERIOD.

CROLY, REV. DR. GEORGE, an English poet, romance-writer, and preacher, of considerable reputation, was born at Dublin, about 1785, and educated at Trinity College there. He entered the English Church, and ultimately became Rector of St. Stephen's, Walbrook, London. His first work was a poem, entitled *Paris in* 1815. From this time up to within a short period of his death, which took place November 24, 1860, his pen was almost incessantly at work—on satire, comedy, tragedy, romance, tales, biography, magazine articles, and the weightier matters of religion. Few subjects came amiss to him, and he exhibited considerable talent in the treatment of most that he touched upon. His best known work is the romance of *Salathiel*. C. was also famous for his eloquence as a pulpit orator.

CRO'MARTY, a parliamentary burgh and seaport in the united counties of Ross and Cromarty, on a low peninsula between the Moray and Cromarty Firths, on the south side of the entrance into the latter, and 18 miles north-north-east of Inverness. It is irregularly built, and its older streets and lanes are in the homely Flemish architecture prevalant in the old towns of the north of Scotland. The harbor admits vessels of 400 tons, and the bay has excellent anchorage for wind-bound vessels. Pop. (1881) 1360. It has manufactures of ropes, sacking, sailcloth, beer. The chief industry is the herring and white fisheries. C. has declined much since the rise, on the north side of Cromarty Firth, of Invergordon, which is more contiguous to the important districts of Easter and Wester Ross. C. unites with Kirkwall, Wick, Dingwall, Dornoch, and Tain, in returning a member to parliament. In the vicinity of C. are a lighthouse and coast-guard station, and within two miles are some caves, and an arch, called Macfarquar's Bed, in the old red sandstone, which rises in some parts 250 feet. Near C. are remains of ancient chapels and camps. Hugh Miller, in whose memory a monument has been erected in the neighborhood, was a native of Cromarty.

CROMARTY FIRTH, a landlocked inlet of the North Sea, on the north-east coast of Scotland, just north-west of the Moray Firth, and enclosed by parts of the counties of Cromarty and Ross. It forms a noble harbor, 18 miles long, running south-west, 3 to 5 miles broad, and 5 to 35 fathoms deep. It receives several rivers, the Conan, entering at its upper end, being 35 miles long. The entrance to C. F. is by a strait between two high wooded cliffs or headlands, the North and South Sutors of Cromarty, only 1½ mile across, with 12 to 30 fathoms of water, and with the Three Kings Reef, about half a mile off land. Near the Firth are the towns of Dingwall, Invergordon, and Cromarty. The largest fleet could ride safely sheltered in this fine sheet of water. In the old red sandstone, near the mouth of the Firth, Hugh Miller discovered the fossil fishes *Pterychthys, Osteolepis*, &c.

CRO'MARTYSHIRE, a county of the north of Scotland, intimately connected, geographically and politically, with Ross-shire, and consisting of ten detached portions in the interior, and along the northern borders of Ross-shire. Area, 344 square miles, or under an eighth of Ross-shire. See ROSS AND CROMARTY.

CRO'MDALE, a village on the east bank of the Spey, Inverness-shire, at which was fought the battle of C., May 1, 1690, between a small remnant of the adherents of the house of Stuart, who kept in arms after the death of Viscount Dundee, and the forces of King William, in which the latter were victorious. This encounter has been rendered famous by a song, entitled *The Haughs of Cromdale*, which, however, is not historically accurate.

CROME, JOHN (sometimes called OLD CROME, to distinguish him from others of his family who painted in the same manner), an English landscape painter, was born at Norwich, December 21, 1769. While a coach-painter's apprentice he devoted his leisure to sketching from nature, and a friend enabled him to exchange this work for that of a drawing-master, which became the occupation of his life. He died April 22, 1821. C. contributed largely to the exhibitions of the Norwich Society of Artists, of which he was president, and sent a few paintings to the London Royal Academy. His reputation has increased since his death, and he now takes a high place amongst English landscape painters. His subjects are chiefly drawn from the scenery of his native country, and he is a masterly draughtsman of trees. His 'Mousehold Heath,' in the National Gallery, is one of the best pictures of a broad, open heath-scene we possess.

CRO'MER, a seaport and watering-place on the north coast of Norfolk, 21 miles north of Norwich. It stands on the top of one of the highest cliffs of the coast. Nearly all the old town, called Shipden, with one of the churches, was swept away by the sea about the year 1500. The sea is still gaining on the land, and some houses have been destroyed by it within present memory. In 1825, some cliffs, 200 feet high, fell into the sea. Seamen call C. Bay the Devil's Throat, from its dangers to navigation. Vessels have to load and unload on the open beach. C. has fisheries for crabs, lobsters, herrings, and mackerel. Pop. of parish (1871), 1423.

CRO'MLECH. It has been common among British archæologists, until lately, to apply this name to a rude structure of two or

more unhewn stones, placed erect in the earth, and supporting a larger stone, also unhewn. According to its etymology, however, cromlech (Celt. *crom*, circle, and *lech*, a stone) is the proper term for circles of erect stones like Stonehenge (see STANDING STONES); and the name *dolmen* (Celt. *daul*, a table, *maen*, a stone) is now considered more appropriate for what used to be called a cromlech. Monuments of the kind above described, whether we

Kit's Coty House.

call them dolmens or cromlechs, are known among the common people by other nam s, such as 'the giant's grave,' 'the giant's bed,' 'the giant's quoit,' 'the fairies' table,' 'the devil's table,' 'the raised stone,' 'the old wives' lift,' 'the hag's bed,' and the like.

Cromlechs are found in England, Wales, Scotland, Ireland, the Channel Isles, France, Spain, Germany, Denmark, and some other countries of Europe; in Hindustan and elsewhere in Asia; and in America. They are generally without any enclosure; but occasionally they are fenced round with a ring of unhewn stones. In a good many instances, cromlechs have been discovered in the heart of earthen mounds or barrows. In such cases, the rude chamber or enclosure of the C. is found to contain sepulchral remains, such as skeletons or urns, together with weapons or ornaments generally of stone or bone, fragments of pottery, and bones of animals.

Similar remains have been found in the chambers of cromlechs not known to have been at any time covered by barrows. These facts have led modern archæologists to believe that the C. was a sepulchral monument. The theory of the older antiquaries, that the C. was a druidical altar, is without any foundation in what has been recorded of the druidical worship by trustworthy writers. In a C. found under a barrow in Derbyshire, a skeleton and fragments of urns were discovered, along with Roman coins of several emperors.

Among the more remarkable cromlechs in England are Kit's Coty House in Kent, Wayland Smith's Cave in Berkshire (commemorated by Sir Walter Scott in *Kenilworth*), and Chun Quoit in Cornwall. The weight of the flat stone in this last C. is estimated at about twenty tons. In the Marquis of Anglesey's park at Plas Newydd in Wales there are two cromlechs close beside each other: in the larger, five erect stones support a flat stone about twelve feet long, ten feet wide, and from three feet and a half to four feet and a half thick. Cromlechs are comparatively rare in Scotland. The best among the well-ascertained examples is perhaps that called 'The Auld Wives' Lift,' near Craigmeddan Castle, in the parish of Baldernock in Stirlingshire: the recumbent stone, a mass of basalt, is eighteen feet long, eleven feet wide, and six or seven feet thick, and the two stones which support it are of nearly the same size. It may be doubted if the partial elevation of the 'Witch's Stone' at Bonnington Mains, near Ratho, in the county of Edinburgh, has not been produced by natural causes. Among the Irish cromlechs, one of the most striking is that of Kilternan, about six miles from Dublin: the recumbent stone, which rests upon six blocks, is twenty-three feet and a half long, seventeen feet wide, and six feet and a half thick. A cromlech called 'The Broadstone,' in the county of Antrim, is surrounded by a circle of standing stones, or erect unhewn pillars. A cromlech in the Phœnix Park, Dublin, was discovered in 1838 in removing a large barrow: specimens of the sepulchral remains found in it are shown in the Museum of the Royal Irish Academy. See DOLMEN.

CRO'MPTON, SAMUEL, whose invention of the spinning-mule entitles him to rank as one of mankind's greatest benefactors, was born at Firwood, Bolton, Lancashire, December 3, 1753. Bolton, in those days, was nearly inaccessible, and so bleak and barren that agriculture was not followed further than to supply the wants of the population. All the farmers had looms in their houses, and their families were occupied in spinning and weaving. C.'s father, who was a small farmer, lived at the Hall-in-th'-Wood, a picturesque old mansion near Bolton. He died at an early age, leaving a wife, and a son (the subject of our memoir), and two daughters. Like his father, C. was brought up to the loom and the farm. His mother, a woman of great energy, perseverance, and stern independence, struggled hard to give him and her daughters the best education the district afforded. When he was old enough, he assisted her in the farm, and wove; going to Bolton at night to complete his education in mathematics, &c.

At the age of 21, he was so much annoyed at the difficulties in getting yarn to weave, that he set to work to invent a spinning-machine which should produce better yarn than Hargreaves', one of which his mother possessed. For five years, he labored to realize his idea, sitting up late at night to overcome the successive difficulties, and resuming his labor for daily bread early in the morning. At length he succeeded in framing a machine which produced yarn of such astonishing fineness, that the house was beset by persons eager to know how such wonderful and desirable yarn could be made. He was rendered miserable. All kinds of devices were tried to gain admission; even ladders were placed against his windows. His machine was such that if a mechanic saw it, he could carry away the leading features of it. He could not leave the house for fear of his discovery being stolen from him. He had spent every farthing he had in the world upon its completion; he had no funds wherewith to have obtained a patent, and it is doubtful whether a patent would have altered his fate. When he was thus almost driven to desperation, one of the manufacturers went to him and persuaded him to disclose the invention to the trade, under the promise of a liberal subscription. Inexperienced in the world, he agreed to this. The machine was exhibited, but all that he got was about £60. This money was not paid to him at the time, but he had to travel for many miles round the country to collect it. Some refused to pay, though he showed them their signatures. He set manfully to work with his machine, determined to make the best he could of his ill-luck. In the course of time, he saved money enough to begin manufacturing on a small scale, but not till his rivals had nearly 20 years' start of him in the business. Then his wife died, leaving him a large family. Efforts were made to obtain for him a national reward. Five thousand pounds was all he obtained, and he returned to Bolton almost broken-hearted. Misfortune upon misfortune overtook him till he died, June 26, 1827. Some idea may be formed of the vast services he has rendered to the world, and especially to his native land, by the fact, that his is by far the most used of all spinning-machines. In 1811, the number of spindles on C.'s principle was 4,600,000, while there were only 310,500 of Arkwright's, and 155,880 of Hargreaves'. At the present time, it is conjectured, that there are 25,000,000 of C.'s spindles at work. Yet this great genius was never noticed by his king, and the appointments under the Factory Acts to which his descendants might have aspired, have been filled by the relatives or nominees of her Majesty's ministers. For a complete account of this great improver of the cotton manufacture, we refer to the *Life of Crompton*, by Mr. G. French, 1860.

CRO'MWELL, OLIVER, was born at Huntingdon, April 25, 1599. His father was the younger son of Sir Henry Cromwell of of Hinchinbrook, and a substantial country gentleman, not likely to have been a brewer, as some of Oliver's earlier biographer's assert. By his mother, genealogists trace Oliver's descent from the royal House of Stuart. Of the boy Cromwell's early life, little or nothing is actually known. What is clearly ascertained is, that after having been at school in Huntingdon, he went to Cambridge, and entered himself of Sidney-Sussex College, April 23, 1616. He had but short time for study here, his father dying in the June of the year following, when he returned home to take the management of his father's affairs. The stories of his wild life about this time appear to have no better foundation than the calumnies of royalists. In August 1620, C. married the daughter of Sir James Bourchier, a gentleman of landed property in Essex, who had also a residence in London. This fact is pretty conclusive as to C.'s social position being much above what his enemies have described it. C. now became intimately associated with the Puritan party, among whom he was soon distinguished alike for his earnestness and sagacity. In 1628, having been elected by the borough of Huntingdon, C. made his first appearance in parliament. He had but time to make a short blunt speech about the encouragement of the 'preaching of flat popery at Paul's Cross' by the Bishop of Winchester, when the infatuated king unceremoniously despatched him and his fellow-commoners to their homes. C. returned to the fen-country, not much impressed in favor of kingcraft by his visit to London; and for the next eleven years devoted himself assiduously to the pursuit of farming by the Black Ouse river and the Cam, first at Huntingdon, then at St. Ives, and finally at Ely—making himself famous not by political agitation, but by an effectual resistance to certain unjust schemes of the king in council for the drainage of the Fens. In 1640, he was sent to parliament as member for the town of Cambridge. His appearance at this time was by no means prepossessing. Sir Philip Warwick describes him in a 'plain cloth suit, which seemed

to have been made by an ill country tailor; his linen was plain, and not very clean; and I remember a speck or two of blood upon his little band, which was not much larger than his collar. His hat was without a hat-band; his stature was of a good size; his sword stuck close to his side; his countenance swollen and reddish; his voice sharp and untunable; and his eloquence full of fervor;' and courtly Sir Philip adds: 'It lessened much my reverence unto that great council, for this gentleman was very much hearkened unto.' When all hope of reconciliation between king and parliament failed, through the perfidy of the former, C. was among the first to offer his substance to aid in defence of the state.

In July 1642, he moved in parliament for permission to raise two companies of volunteers in Cambridge, having been careful to supply the necessary arms beforehand at his own cost. In the following month, C. seized the magazine in Cambridgeshire, and prevented the royalists from carrying off the plate (valued at £20,000) in the university there. As captain of a troop of horse, C. exhibited astonishing military genius; and against the men trained by himself—'Cromwell's Ironsides'—the battle-shock of the fiery Rupert, which at the beginning of the parliamentary struggle none else could withstand, spent itself in vain. Soon promoted to the rank of colonel, and then to that of lieutenant-general, C., in the fight of Winceby, on the bloody field of Marston (July 2, 1644), and in the second battle of Newbury (October 27, 1644), bore himself with distinguished bravery; but owing to the backwardness of his superiors, the results of these victories to the parliamentary cause were not so great as they might reasonably have been. C. thus complained in parliament of the backwardness of his superiors, Essex and Manchester: 'I do conceive if the army be not put into another method, and the war more vigorously prosecuted, the people can bear the war no longer, and will enforce you to a dishonorable peace.' Hereupon, the 'Self-denying Ordinance'—an act excluding members of the houses of parliament from holding command in the army—was passed; but C.'s services were considered of such importance to the common weal, that they were exceptionally retained. Of the new model army, Fairfax was appointed general, C. serving under him as lieutenant-general of the horse, and in this capacity he commanded the right wing of the parliamentary army at Naseby, June 1645, and acquitted himself so well there, that the king's forces were utterly ruined. The royalists in the west were now speedily reduced. Bristol was stormed; everywhere the royal cause was failing; and Charles himself, reduced to the last extremity, in May 1646 escaped from Oxford in disguise, and threw himself into the arms of the Scotch army at Newark (May 5, 1646), by whom he was shortly given up to the parliamentary commissioners. The source of the strife now fairly within their grasp, the parliament and the army, in the former of which the Presbyterian, and in the latter the Independent, element predominated, became jealous of each other's power. With his usual sagacity, C. perceived that the advantage would lie with that party who held possession of the king's person, and with ready decision he had him removed from the hands of the commissioners into those of the army, June 1647. Some of the leading Presbyterians were now turned out of parliament by the army, and Independency, with C. at its head, was gradually obtaining the ascendency. The king still remained with the army, and with his usual duplicity, negotiated with both parties, not without hope that out of their mutual dissensions might arise advantage to himself.

On the 11th November 1647, the king made his escape from Hampton Court. Two days after, he was in custody of Colonel Hammond in the Isle of Wight. At this time the country was in a critical condition. The Welsh had risen in insurrection, a Scotch army was bearing down from the north with hostile intent, and Rupert, to whom seventeen English ships had deserted, was threatening a descent from Holland, not to speak of the rampant royalism of Ireland. Prompt measures alone could prevent anarchy and inextricable confusion, and C. was not afraid to employ them. Pembroke had to surrender, and at Preston Moor the Scotch were utterly defeated. On the return of the army to London, the Presbyterians, who were still blindly temporizing with the king, to the number of more than 100, were driven out (December 1648) by the process known in history as 'Pride's Purge.' Then that which C. thought could alone end the strife, happened. In January 1649, the king was tried, condemned, and executed. The abolition of the House of Lords followed speedily, and C. became a prominent member of the new Council of State; and in the army, though still only lieutenant-general, he had really much more influence than the commander-in-chief. The royalists being still strong and rebellious in Ireland, C. went thither in August, with the title of lord-lieutenant, and commander-in-chief of the army there; and ere nine months had passed, he had subdued the country so far, that it might be safely left to the keeping of his son-in-law, Ireton. C.'s measures for crushing the Irish rebels were indeed severe, and even sanguinary, but, nevertheless, peace and prosperity followed in a degree unknown before in the history of that unhappy country. Affairs in Scotland now claimed C.'s attention. Scotch commissioners had been negotiating with Charles II. at Breda, had urged him to come among them and take the Covenant, and they would crown him king over them at least, and do what force of arms could do to make him king of England also. Charles arrived in the north of Scotland on the 23d June 1650; three days thereafter, Cromwell—Presbyterian Fairfax having refused to fight against the Presbyterian Scotch—was appointed commander-in-chief of all the parliament forces. On the 15th of July, Charles Stuart had signed the Covenant, and was fully accepted as king. On the 3d September following, C. routed the Scotch army at Dunbar. Charles, with what force remained, and other accessions, afterwards marched southward, and had penetrated to Worcester, when C. came up with him, and utterly overthrew the royalists on the anniversary of the battle of Dunbar. This battle placed C. avowedly at the head of public affairs in England, and to write his biography from this time until his death, would be to write the history of the Commonwealth. The Long Parliament had now degenerated into the Rump—had become, in truth, an oligarchy, given to long and useless discussions about mere technicalities—intolerable to the country alike for the extraordinary power it possessed, and for the weak, pusillanimous way in which it exercised it. C., therefore, dissolved the Rump, 20th April 1653, and henceforth he alone was ruler in England.

He immediately summoned a parliament of 140 persons, 138 of whom assembled on the 4th of July, but he found it necessary to dissolve it on the 12th December; its one great work having been the legal investiture of C. with the supreme power and the title of Lord Protector, a position upon which the principal foreign powers hastened to congratulate him. C. now acted in a very arbitrary manner, so far as his parliaments were concerned, calling them and dismissing them at pleasure; but his home policy, notwithstanding, was just and liberal towards the mass of the people, and conducive to the prosperity of the country; while his foreign policy was such as to secure England a position among nations more commanding than any she had ever occupied before. Under C.'s rule, swift retribution followed any indignity or injury to Englishmen, no matter by whom or where perpetrated; and religious persecutors on the continent, in terror, stayed their bloody swords on the stern summons of the Lord Protector. He died September 3, 1658, the anniversary of some of his most important victories. C. was buried in Westminster Abbey; but on the 30th January 1661 (the anniversary of the death of Charles I.) his grave, along with those of Ireton and Bradshaw, were broken open, the coffins dragged to Tyburn, where the mouldering bodies were hanged, and then thrown into a deep hole under the gallows, while their heads were set upon poles on the top of Westminster Hall. Such was the sacrilegious brutality of the king and clergy (for the deed was done by their authority) towards England's greatest ruler. It was long a fashion with historians, content to rely upon the calumnies and falsehoods of royalist writers, to represent C. as a monster of cruelty and hypocrisy—a man with a natural taste for blood, who made use of religious phraseology merely to subserve his own ambitious ends; but after the researches of Carlyle and Guizot, the eloquence of Macaulay, and the clear statement and sound sense of Forster, such a view can no longer be upheld. C.'s religion was no mere profession, it was the very essence of the man; by nature, he was not a blood-shedder, and when necessity demanded the grim exercise of the sword, he unsheathed it with reluctance. Never was a religious man less of a bigot; he would not, in so far as his iron will could effect his purpose, permit any one to be persecuted for religious opinions. He delivered Biddle, the founder of English Unitarianism, out of the hands of the Westminster divines. He would have even given the despised and persecuted Jews the right hand of citizenship. He grasped power, and dispensed with the formality of parliaments, only because he sought to promote, in the speediest possible manner, the prosperity, happiness, and glory of his native land.

CROMWELL, Richard, son of Oliver Cromwell, Lord Protector of England, was born at Huntingdon, October 4, 1626. In early life, he was noted chiefly for his indolence and love of pleasure, qualities that united him more closely to the cavaliers than to the party of earnest men of which his father was the chief. When Oliver attained the dignity of Lord Protector, he called his son from the obscurity of a country-house, and his field-sports, to have him elected for the counties of Monmouth and Southampton, appointed him First Lord of Trade and Navigation, and made him Chancellor of Oxford. In none of these capacities did Richard C. exhibit any aptitude; and his failure as Protector, to which high office (being the eldest surviving son) he succeeded, on the death of his father, September, 1658—was still more conspicuous. With a mediocre intellect, and no energy, hardly a friend in the army, and the first parliament he called against him, the result could not be otherwise than it was—his demission (April

1659)—little more than seven months after he had assumed the sceptre of the Commonwealth. He retired to Hampton Court, from whence parliamentary stinginess and pressing creditors soon drove him to the continent, where he resided for a considerable period. At length, returning to England, he had a house provided for him at Cheshunt, near London, where he resided in strict privacy until his death, in 1712.

CROMWELL, THOMAS, an eminent English statesman and ecclesiastical reformer, of the reign of Henry VIII., was born near London in very humble circumstances, his father being a blacksmith, about 1490. After receiving but a very meagre education, he went to the continent, and became clerk in a factory at Antwerp, where he devoted his spare time to the acquisition of languages, in which he became very proficient. In 1510, he went into Italy, where he appears to have resided until about 1517, when he returned to England; and, after some time, was received into the household of Wolsey. That prelate, speedily recognizing his abilities, made him his solicitor and chief agent in all important business. As a member of the House of Commons, C. warmly and successfully defended the fallen minister, his master, against the bill of impeachment—proof enough that he was not the heartlessly ambitious man that his enemies have represented him. Henry, admiring his chivalry, and appreciating his talent, made him his own secretary; knighted him in 1531, and made him a privy-councillor. Honors rapidly flowed in upon him; partly in consequence, it is said, of his having suggested to Henry the desirableness of throwing off the papal yoke altogether—an idea which suited well with the king's impetuous nature—but chiefly, no doubt, on account of his great abilities.

In 1534, he had become chief Secretary of State, and Master of the Rolls; in the following year, he was made Visitor-general of English Monasteries—which he afterwards suppressed in such fashion as to obtain for himself the designation of *Malleus Monachorum*—and keeper of the privy seal in 1536. In 1539—to pass over a variety of minor tokens of royal approbation—he had risen to be Earl of Essex—having had some thirty monastic manors and estates given to him to keep up the dignity of his title—and Lord Chamberlain of England. C. took the leading part in establishing the doctrines of the Reformation, though he seems to have done so less on religious than on political grounds. The destruction of the pope's authority, and the establishment of the supremacy of the king in England, were what he labored to effect; and with this view, he promulgated the articles of the new faith, had English Bibles placed in the churches, and the youth of the nation taught the Creed, the Ten Commandments, and the Lord's Prayer; and ordered the removal of all images from the altar. In this matter of ecclesiastical polity, he has, says Mr. Froude, in the third volume of his *History of England*, 'left the print of his individual genius stamped indelibly, while the metal was at white heat, into the constitution of his country. Wave after wave has rolled over his work. Romanism flowed back over it under Mary; Puritanism, under another even grander, Cromwell, overwhelmed it. But Romanism ebbed again, and Puritanism is dead, and the polity of the Church of England remains as it was left by its creator.' In all that concerned the state, in its vastest and most complicated foreign relations, as well in the smallest matters of sanitary reform at home, C. took an active personal interest. But the stern, almost savage manner in which, in the carrying out of his policy, he disposed of all who opposed him, led to many and loud complaints, which damaged somewhat his popularity with the king. In order to retrieve his lost ground, he was zealous in promoting the marriage of Henry with Anne of Cleves, from whom, on account of her known Lutheran tendencies, he expected strong support. The success of his efforts in this matter proved the utter ruin of C., for the king, early conceiving a strong aversion to his unlovely queen, extended that dislike to the minister who had so strenuously promoted the marriage. Complaints against C. poured in thicker and faster, and the royal ear was not unwilling to listen now. Charges of malversation and treason were made, and he was arrested and thrown into prison (10th June 1540); a bill of attainder was quickly drawn up, and passed the two Houses of Parliament with little difficulty; and on the 28th July following, C. laid his head on the block on Tower Hill. A statesman of undoubted genius, he saw what was best for his country, and did it—not certainly in a way commending itself to the judgment of the present time—but, perhaps, among the best and only sure modes that could be devised in his age. He was undoubtedly unscrupulous, and very haughty towards the high; but the poor and weak found him easily accessible, and, when wronged, a warm defender; and though he was rapacious, the hungry had, nevertheless, to thank his generosity for many a meal.

CRONSTADT, a strongly fortified seaport, about 20 miles west of St. Petersburg, on a narrow calcareous island of about five miles in length, at the narrowest part of the Gulf of Finland, and over against the mouth of the Neva. Lat. (of cathedral) 59° 59′ 46″ N., long. 29° 46′ 38″ E. C. is at once the greatest naval station and the most flourishing commercial port of Russia. It was founded by Peter the Great in 1710, the island having been taken from the Swedes by him in 1703. Its fortifications, which protect the approach to St. Petersburg, have been an object of great attention to the Russian government. The batteries are very numerous, defending every part of the channel by which vessels can enter. They are all built of granite, and armed with the heaviest ordnance. The place, indeed, was considered by the British admiral who reconnoitred it during the Russian war of 1854—1855, so impregnable, that it would have been utter madness to make any attempt upon it. C., which is the seat of the Russian Admiralty, has three harbors: the east, intended for vessels of war, and capable of accommodating 30 ships of the line; the middle harbor, where vessels are fitted up and repaired, and which is connected with the former by a broad canal; and the west or Merchant's Harbor, for the merchant-shipping, with capacity for 1000 vessels; all are admirably defended. Not only the trade of St. Petersburg is conducted through this port, but that of a great part of the interior of Russia, which is connected with it by navigable rivers and canals. C. contains many well-built houses; the population in summer amounts, with the garrison of about 20,000 men, to 45,000 or 50,000; in winter it is much less.

CROOK, belonging to musical instruments, such as the French-horn or trumpet, is a circular tube, which fits into the end of the instrument next the mouthpiece, for the purpose of making the pitch of the instrument suit the key of the music; the notes of the parts for these instruments being always written in the natural key of C, with the name of the key of the piece marked in letters.

CROOK, SHEPHERD'S. See PASTORAL STAFF.

CROOKED ISLAND, one of the Bahamas, contains 160 square miles, and about 630 inhabitants. It lies to the south-east of Long Island, of which the north-west extremity forms nearly the middle point of the chain. In common with some others of the group, it is valuable chiefly for its salt. In the exportation of this article, C. I. appears to stand third in order, its share counting 12,000 bushels annually. The Bahama Salines are all the more important from the fact, that, for the curing of fish, salt obtained by solar evaporation is preferred to that procured from mines.

CROP, or OUT-CROP, is the edge of a stratum where it rises to the surface, or, as the miners say, comes out to the day. The line of out-crop of a bed along a level surface is called its *strike;* it is described by its relation to one or other of the points of the compass.

CROQUET, an open-air game, in which two or more players endeavor to drive wooden balls, by means of long-handled mallets, through a series of arches set in the ground according to some pattern. The player who first makes the complete circle of the hoops or arches wins the match; but during the progress of the game, each player may have the progress of his ball retarded by his adversaries, or assisted by his allies; and these friendly aids and hostile attacks constitute the chief interest of croquet. A *croquet-ground* should be a well-rolled level grass-plot or lawn, not less than thirty yards long by twenty yards wide; a full-sized croquet-ground measures forty yards by thirty yards.

CRO'SIER, a staff surmounted by a cross, which is carried before a bishop on solemn occasions. It is about five feet long, is generally made of tin, and is hollow. Crosiers are generally gilt, and are often richly ornamented. The C. differs entirely from the pastoral staff, with which it is often nevertheless confounded—the latter having a circular head, in the form of a crook. The illustration is of Archbishop Warham's crosier (1520), from Canterbury Cathedral.

CROSS. The C. was a common instrument of capital punishment among the ancients; and the death of the C. was esteemed so dishonorable that only slaves and malefactors of the lowest class were subjected to it by the Romans. It was customary to proclaim the name and offence of the person crucified, or to affix a tablet (*album*) to the C., on which they were inscribed. Malefactors were sometimes fastened on a simple upright stake, and so left to die, or they were impaled upon it, and to this upright stake the Latin name *crux* was originally and more strictly applicable; but very generally a cross-piece (*patibulum*) was added to the stake, to which the arms of the criminal were tied, or to which his hands were nailed. When the cross-piece was fastened at right angles below the summit of the upright stake, the C. was called *crux immissa;* and when the cross-piece was fastened at right angles across the top of the upright stake, the C. was *crux commissa;* and when it was

formed of two beams crossing one another obliquely, it was *crux decussata*.

The C. was erected without the gates of towns, but in places of frequent resort. The person crucified often lived for days upon the cross. The death of Christ by crucifixion led Christians to regard the C. with peculiar feelings of reverence, and to make use of the sign of the C. as a holy and distinguishing sign. The custom of *crossing*, in honor and commemoration of Christ, can be traced back to the 3d century. The Emperor Constantine, after obtaining the victory over Maxentius, through the influence—as he believed—of the sign of the C., caused crosses to be set up in public places and upon public buildings; and the veneration of the C. increased, particularly after the *Invention of the C.*, or finding of the alleged true C. of Christ in Jerusalem by the Empress Helena. See CROSS, INVENTION OF. The desire for relics was gratified, and numberless portions of the true C. were given away, without its being diminished. Iconoclasts and others contended in vain against the prevalent worship of the C.; and the *crucifix* (q. v.), a C. with an image of the Saviour affixed to it, was honored more than any other image. The sign of the C. is made not only by Roman Catholics, but by the members of the Eastern churches also; there are, however, distinctive differences in the manner in which it is made. It is admitted by the Lutherans as a commemorative sign of the atoning death of Christ, but by many Protestants is rejected as a human invention in worship, and as tending to superstition. It was very generally used during the middle ages, and still is among the less enlightened peasantry in some Roman Catholic countries as a sort of charm, or as affording some security, like an amulet, against all evil, and particularly against evil spirits and witchcraft.

It appears that the sign of the C. was in use as an emblem, having certain religious and mystic meanings attached to it, long before the Christian era; and the Spanish conquerors were astonished to find it an object of religious veneration among the natives of Central and South America. Be this as it may, it was early adopted as a symbol by Christians, with express reference to the central fact of their religion, and it has been extensively used as an ornament in Christian architecture, and in the ground-plan of churches (q. v.). The C. of the Resurrection is opposed to the C. of the Passion, by ecclesiastical writers. It is a lance, headed by a C. instead of a pike, and carrying a banner upon which a C. is depicted. It is the C. held by the paschal lamb, and carried at the head of religious processions. The large C. always placed over the entrance of the main chancel of a church, was called the *rood*, or *holy rood*. A representation is here given of the top of one of these large ornamental crosses.

The forms given to crosses in art are endless; but the two leading types are the Latin C., or *crux immissa*, supposed to be that on which Christ suffered, and the Greek C., both of which are subject to many fantastic variations. The Greek C. forms the well-known C. of St. George, which, adopted from the legends of that hero, was the national ensign of the English previous to the union with Scotland. The C. of St. Andrew differed entirely in form from the Latin or Greek cross. This C., or *crux decussata*,

Greek Cross. Latin Cross. St. Andrew's Cross.

consisted of two shafts of equal length crossed diagonally at the middle, as in the annexed cut. According to the legend, this was the form of C. on which St. Andrew, the national saint of Scotland, suffered martyrdom. As the Scottish ensign, it is now blended with the C. of St. George in the Union Jack.

Many very beautiful crosses exist in England, upon the points of gables of churches, on gravestones, and in other situations, as also in heraldry. Among these, the C. most commonly seen is called the *C. crosslet*. In this figure, as seen in the annexed cut, the extremities are intersected, so as to make several small crosses. When employed in ecclesiastical architecture, the figure is usually carved in a florid or highly decorative style. When the C. crosslet is pointed at the lower extremity instead of being crossed, it is in heraldry said to be fitched or *fitchée*. It is of frequent use in blazon.

Sanctuary, *Boundary*, or *Monumental Crosses*, as they are called, consist of an upright flat pillar or obelisk, covered with sculptured devices, and set in a socket level with the ground. Occasionally, they appear to have marked boundaries, but more frequently were monuments over the graves of heroes, kings, bishops, &c. In some instances, they probably marked the verge of a sanctuary. A characteristic type of cross is the *Celtic Cross*, most frequently found in Ireland and in the north and west of Scotland. Such crosses vary much, from a cross incised on a flat slab to an elaborate cruciform monument. The majority of the latter seem to belong to the period between the 12th and 15th centuries. One of the best known is that at Iona called St. Martin's

St. Martin's Cross, Iona.

Waltham Cross, restored.

Cross, standing in the grounds of the cathedral. It is a column of compact mica schist, 14 feet high, 18 inches broad, and 6 inches thick, and is fixed in a pedestal formed out of a massive block of red granite, about 3 feet high. In connection with certain ancient religious houses in Ireland, there were very fine Celtic crosses. Some crosses of this type show Scandinavian workmanship; hence they are often called *Runic* crosses.

Memorial Crosses are those which were erected in memory of some beloved object, or in commemoration of some event of local importance. In England, there are some superb crosses of this kind; they are popularly called *Norman Crosses*. This species of C. resembled a Gothic turret set on the ground, or on a base of a few steps, and was decorated with niches for figures and pinnacles. The best known examples are those erected by Edward I. (1290) in memory of his queen Eleanor; being placed on the spots where the body rested in its funereal progress to Westminster. The crosses at Waltham, Cheapside, and Charing were of the number. Those at Cheapside and at Charing are destroyed, but the C. at Waltham, though now much decayed, remains as a testimonial of the affection and piety of the greatest of the Plantagenets. We present a sketch of this beautiful Norman cross, as restored.

Town or *Market Crosses* were erected as stands to preach from, or in commemoration of events regarding which it was deemed proper to evoke pious feelings. As these structures were incorporated with or surmounted by a crucifix, the term *cross* was so indeliably associated with them that it survived the religious

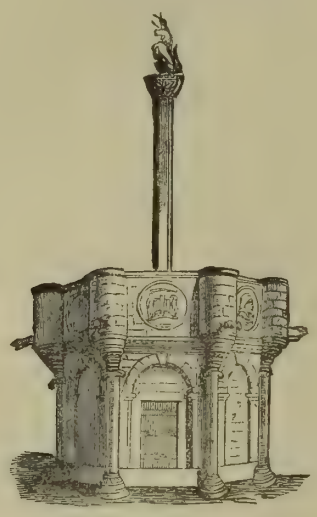
St. Paul's Cross.

character of the fabrics. 'The general intent of market-crosses was to excite public homage to the religion of Christ crucified, and to inspire men with a sense of morality and piety amidst the

ordinary transactions of life.'—Milner's *History of Winchester*. The earliest examples of this kind consisted, probably, of tall crucifixes of wood, such as are still seen by the waysides in some continental countries. Afterwards, stone shafts would be substituted; and according to the increase of market revenues, or progress of taste, these town crosses assumed that imposing character which they latterly possessed. Of the larger ornamental crosses of this kind, there are some striking specimens in England.

We may refer to that at Cheddar in Somersetshire, and that at Malmesbury in Wiltshire; both are open vaulted structures, with a commodious space beneath, as a refuge for poor market-folks during rain, and surmounted with a kind of Gothic turret. At Chichester, Bristol, and Winchester, the market-crosses, while similar in form, are of a higher architectural quality. See Britton's *Architectural Antiquities*. Adjoining St. Paul's in London, stood Paul's C., a structure which we read of as early as 1259, in

Peebles Cross.



Edinburgh Market-cross.

the reign of Henry III. It was essentially a town-preaching C., and is associated with some interesting occurrences in history. Before this C. the unfortunate Jane Shore was forced to do penance in the reign of Richard III., to whose malice she was made a victim. This event was followed by Dr. Shawe's infamous sermon, attempting to bastardize the children of Edward, and eulogizing Richard, who was present on the occasion. In front of this C. sat Cardinal Wolsey, to hear fulminations against Luther; and about ten years later, by order of Henry VIII., preachers here delivered sermons in favor of the Reformation. At this C. Queen Elizabeth attended to hear a thanksgiving sermon for the defeat of the Spanish Armada. Here, sermons continued to be delivered until 1643, when, with other so-called relics of popery, the C. incurred the displeasure of the Puritans, and was demolished by order of parliament. Whatever was the original form of Paul's C., it was in later times a plain pulpit-like fabric of wood, covered with lead, and, as seen by the adjoining cut, was provided with seats for an audience. This inoffensive and really useful preaching C., which we could wish had been spared, stood on the north side of the church, a little to the east of Cannon Alley.

Scotland offers no specimens of memorial or Norman crosses, though, perhaps, we should make an exception in favor of the Scott Monument, at Edinburgh, which is essentially a Norman C. of a gigantic order. See SCOTT, SIR WALTER. As regards the market-crosses of Scotland, they never attained to that elaborately ornate character which distinguishes such crosses as those of Chichester and Winchester. Yet the Scottish town-crosses had some distinguishing features. The more simple kind consisted of a shaft of stone, generally octangular in shape, and 12 or more feet in height. At top was an ornamental capital, which bore a dial and vane, or the figure of a unicorn. The shaft sprang from the top of a graduated flight of circular or octangular steps. A specimen of this species of C. is seen in the market-place of Melrose. Another specimen, renovated and set in the quadrangle of the Chambers Institution, Peebles, is shown in the annexed cut. The grander market C. consisted of a tall stone shaft, such as just described, but instead of steps, it sprang from the center of an imposing sub-structure.

This structure was circular, hexagonal, or octagonal, and from 10 to 16 feet high. The top formed a platform, which was surrounded with an ornamental stone parapet, and was reached by a stair inside. The sides of the building were decorated with pilasters, and bore various heraldic and other devices. Such were the crosses of Edinburgh, and such is the renovated C. of Aberdeen, the sides of which, however, are open. Losing their religious character, the Scottish market-crosses were employed for royal and civic proclamations, and as places where certain judicial writs were executed. The general removal of these ancient and interesting structures has been often matter of lamentation. The oldest C. of Edinburgh, which was the scene of a number of incidents connected with Scottish history, stood in the center of the High Street, nearly opposite the entrance to the Parliament Square. It was removed in 1617, to make way for a royal pageant, the procession of James VI., on his first visit to Edinburgh after his removal to England. A new market-C. was then erected a short way further down the street, on the south side. We give a sketch of this C., which consists of an octangular sub-structure 16 feet across, with a handsome stone shaft of about 20 feet in height; its removal in 1756, by the civic authorities, is indignantly referred to by Scott in his poem of *Marmion*. Since its removal, royal proclamations, &c., are made on the site, which for such purposes is technically the market-C. of Edinburgh. With better appreciation of objects of archæological interest than prevailed in the 18th c., the shaft, or cross proper, was re-erected in 1869 within the railings of St. Giles.

CROSS, in Heraldry. If we assume the art of blazon to have originated in connection with the Crusades, it will not surprise us to find the symbol of the Christian faith so frequently introduced into the escutcheons of ancient and noble families everywhere in Europe. It is one of the honorable ordinaries, and, indeed, from its sacred character, is esteemed by heralds as the most honorable charge. Its form varies so much that Ménestrier counts 42 crosses; La Colombière, 72; and Guillim, 39. Most of the architectural crosses occur in heraldry, along with many others.

CROSS, INVENTION OF THE, the name given in the Roman Catholic Church to a festival which commemorates the finding of the alleged true C. of our Saviour, and which is celebrated on the 3d of May. The Empress Helena, the mother of Constantine the Great, out of a desire of visiting the holy places, undertook a journey to Palestine in 326, though she was then near eighty years of age; and being animated with a great desire of finding the C. on which our Saviour suffered, she was so well directed, it is said, in the search which she instituted, that the C. was found, and with it the crosses of the two thieves; but the title being found separate from the C., a miracle readily determined which was the proper object of reverence. An order of friars, founded in honor of the Invention of the Cross, and carrying in their hand a staff, on the top of which was a C., received the name of *Croisiers* (Fr. *croix*, cross), corrupted into *Crouched* or *Crutched* Friars. They came to England in the 13th c., and had monasteries in London, Oxford, and Ryegate.—The festival of the *Elevation of the Cross* (14th September) commemorates its re-erection in Jerusalem by the Emperor Heraclius in 628, after it had been carried away by the Persians.

CROSS, VICTORIA. The peculiarities of this decoration, which was instituted on the termination of the Crimean campaign in 1856, are, that it may be granted to a soldier of any rank, and for a single act of valor.

The C. of the Legion of Honor, as was felt during the Crimean campaign, served a purpose in the French army which was served by none of our decorations, and it was in imitation of it that the Victoria C. was founded, with the inscription 'For Valor,' and which can be given to none but those who have performed, in presence of the enemy, some signal act of valor or devotion to their country. The general distribution of the crosses earned in the Crimean war took place in Hyde Park on the 26th June 1857. The recipients were 62 in number. The Victoria Cross is in the form of a Maltese Cross, and is made of bronze. In the center is the royal crown, surmounted by the lion, and below, on a scroll, the words 'For Valor.' The ribbon is blue for the navy, and red for the army. On the clasp are two branches of laurel, and from it the cross hangs, supported by the initial 'V.' The decoration is accompanied by a pension of £10 a year.

Victoria Cross.

CROSS, THE ORDER OF THE, originally a spiritual order of knighthood, which sprang up in Palestine in the time of the Crusades, and was then called the *Bethlehemite Order*. After the commencement of the 13th c., the knights of this order adopted the monastic life, settling chiefly in Austria, Bohemia, Moravia, Poland, and Silesia. Pope Gregory IX. confirmed the order in 1328. Its principal seat is now in Bohemia, and its members generally hold ecclesiastical preferments or professorships in the

university of Prague. They are distinguished by a C. of red satin, with a six-pointed star under it, and are sometimes called *Stelliferi*.

CROSS, The Southern, the most conspicuous constellation in the southern hemisphere, situated near the Antarctic Circle, and therefore never visible to our latitude. It consists of four bright stars, to which the fancy, aided by Christian associations, readily gives the cruciform shape. The two brilliant stars which mark the summit and the foot of the C. have nearly the same right ascension. The constellation, therefore, is almost perpendicular when passing the meridian, and these two stars act as pointers to the Antarctic pole.

CROSS BILL IN CHANCERY is a suit brought by the defendant against the plaintiff in the original suit, for the purpose of setting up some claim or defence which could not be maintained in the original suit.

CROSSBILL (*Loxia*), a genus of birds of the family *Fringillidæ*, much resembling bullfinches, linnets, &c., except in the bill, which is altogether singular; the two mandibles—which are rather long, thick at the base, and much curved—crossing each other at the points, when the bill is closed. In different individuals, even of the same species, the upper and lower mandibles are

Crossbill (*Loxia curvirostra*).

found variously directed to the right and left. This conformation was rashly characterized by Buffon as 'an error and defect in nature, and a useless deformity;' whereas, it is an admirable adaptation to the wants and habits of the birds, and other peculiarities of their structure beautifully correspond with it—the bill being articulated to the head in such a manner that the mandibles are capable not merely of vertical but of lateral motion, and muscles of extraordinary power, in comparison with the size of the bird, being provided for moving them. The result of all this is, that the crossbills readily obtain their principal food, the seeds of firs and pines, by tearing up the cones.

They bring the points of the mandibles together—which they can do so as to pick up a very small seed—and insert them into the cone, when a powerful lateral movement widens the opening quite sufficiently, and the tongue, which terminates in a singular movable scoop, formed of a bone articulated to the *os hyoides*, or ordinary bone of the tongue, is inserted to detach the seed. The power of the bill is such that it can be employed in its lateral movements to tear wood to pieces, and crossbills in confinement seem to take a mischievous pleasure in so employing it, and by this means, and pulling at wires, soon destroy any ordinary cage. An apple is cut to pieces almost in an instant, in order that its seeds may be reached; and flocks of these birds sometimes do great mischief in orchards. Only three species are known, all of which have been found in Britain, although only one, the common C. (*L. curvirostra*) is of frequent occurrence. It sometimes occurs in considerable numbers, but in most years is scarcely to be seen. It is a native of Europe, Asia, and North America, dwelling chiefly in pine forests, and extending as far north as they do, not dreading the coldest climates.

CROSS-BOW. See Arbalest, Archers and Archery.

CROSS BREEDING. See Breeding.

CROSS BUNS, a small cake specially prepared for Good Friday, and in many towns of England cried about the streets on the morning of that day as 'Hot-cross buns.' *Bun*, means simply a round cake—properly, a lump, being from the same root as *bunion*, Ital. *bugno*, a bump or knob; allied is the Gael. *bonnach*, a cake, a *bannock*. Good-Friday buns were appropriately marked with the cross, and hence the name. The origin of the practice is obscure. Most probably it is a relic of some heathen observance, to which the early church gave a Christian significance. At Chelsea, there were formerly two celebrated bun-houses, besieged on Good Friday from morning until night by hundreds of eager purchasers, but they have long since disappeared.

CROSS CROSSLET. See Cross.

CROSSE, Andrew, a remarkable experimenter on electricity, born at Fyne Court, in the Quantock Hills, Somersetshire, June 17, 1784, was educated at Bristol and Brasenose College, Oxford, and in 1805—1806, settled on his paternal estate, where he began to devote himself to the study of electricity. Happening on one occasion to examine a cavern near his residence, he found reason to conclude that the crystallizations on the walls and roof were partially, at least, the effect of the operation of this subtle agency. In 1807, he commenced experiments with the view of forming artificial crystals by electricity. He took home some of the water which dropped from the roof of the cave, and exposed it to the action of a voltaic battery for ten days, when he found crystals of carbonate of lime forming on the negative platinum wire. C.'s endeavors to form crystals of various sorts were very successful.

After 30 years of quiet research, during which period he remained totally unknown to the learned world, he obtained no less than 24 minerals, crystals of quartz, arragonite, carbonates of lime, lead, and copper, besides more than 20 other artificial minerals. Explaining his discoveries at the meeting held by the British Association for the Advancement of Science, at Bristol in 1836, he received high praise from its most distinguished members. On this occasion, he also expressed his belief that every kind of mineral would yet be formed by the ingenuity of man. But his most startling discovery occurred a few months after. While experimenting with some highly caustic solutions, out of contact with atmospheric air, there appeared, as if gradually, growing from specks between the poles of the voltaic circuit, certain animals of the genus *acarus*. C. never affirmed that he had developed animal life out of inorganic elements, but simply that under certain physical conditions he could make acari appear, and not otherwise. The 'discovery' made a great noise at the time. The possibility of the fact was, of course, denied by all those persons who 'take the high *priori* road,' and have made up their minds as to what facts alone are possible; but Faraday declared that he had seen, during the same year, similar appearances in his own electrical experiments. C. was accused of 'impiety,' and of being 'a reviler of our holy religion,' and although a very pious man, was actually compelled to defend himself against such pitiable charges. It is humiliating to state that, in spite of his defence, various honors to which he was justly entitled, were lost to C. in consequence of his discovery. C. also invented a method of purifying sea-water by electricity, improved wines, spirits, and cider by the same process, and showed that it might be usefully applied to vegetation. He died July 6, 1855. An excellent memoir of him was published by his widow (1857).

CRO'SS-EXAMINA'TION. The examination of a witness by the party against whom he was adduced. In England, the following are the principal rules affecting C.: 1. The witness may be cross-examined on the whole case, and not merely on the points on which he had been examined in chief. 2. Leading questions may be put in cross-examination. 3. Irrelevant questions may often be put, but if for the mere purpose of impeaching the witness's credit, they are inadmissible. 4. For the purpose of impeachiug the character of the witness, he may always be asked whether he has been guilty of a crime, but he is not always bound to answer. 5. Evidence may be brought to contradict the answer given on C., on relevant facts, but not on irrelevant, unless the irrelevant fact be the conviction of the witness of a felony or misdemeanor. 6. A witness may be cross-examined as to any previous statement made by him relative to the trial (except matter of mere opinion as to the merits of the case), and evidence may afterwards be brought to contradict him. See Evidence.

CROSSOPO'DIA, a genus of annelids determined from markings on the surface of Silurian slates. Nothing exhibiting structure has been observed—the surface of the slate is not even darkened by the organisms, which the markings show to have been nereid-like worms of some six inches in length. The extraordinary length, 'probably many yards,' which was ascribed to this animal, has been shown by Alexander Bryson to be founded on a confusion of the body with the track formed by the passage of the creature through a crisp rather than a slimy mud, the track having been filled up with dry blown dust, which gives it an appearance and structure different from those of the surrounding matter.

CROTALA'RIA (Gr. *krotalon*, a rattle), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, deriving its name from the inflated pods in which the seeds rattle when ripe. The species are numerous; annual perennial, and shrubby plants, natives of the warm parts of the world. Many of them have long, straight, slender stems aud branches, and some of these yield valuable fibre, particularly *C. juncea*, the Sunn (q. v.), or Sunn Hemp of India, an annual species, the fibre of which is now an important article of commerce. Jubbulpore Hemp, also an important fibre, and regarded as stronger than Sunn, is the produce of *C. tenuifolia*, a perennial species about nine feet high, a

native of the south of India, which, when growing in abundant space, throws out many branches; but when sown thick, grows with little branching. *C. Burhia*, which naturally grows in very arid places, is also cultivated in Sinde for its fibre; and that of *C. retusa* is employed in the Madras presidency. *C. juncea* is also often sown in India, to be used in a young state for feeding cattle.

CROTA'LIDÆ, a family of venomous serpents, agreeing with *Viperidæ* in their general form and appearance; in their large head, which is broad behind and has a short muzzle; in their short tail; and in having long fangs in the front of the upper jaw, which is destitute of other teeth; but differing from them in having a large pit—the use of which is not known—on each side of the face between the nostril and the eye; and in having the tail terminated by a sort of horny spine or by a rattle. Many of the most dangerous serpents of the warm parts of Asia and America belong to this family, which receives its name from the rattlesnakes (q. v.), (Gr. *crotalus*, a rattle) of America, and contains also the genera *Trigonocephalus*, *Craspedocephalus*, *Lachesis*, &c.

CROTCH, WILLIAM, a distinguished musical composer, was born at Norwich in 1775. His musical genius was quite as precocious as that of the great Mozart.

When little more than three years old, it is said that he could play *God save the King* almost throughout with chords, and the accuracy of his ear was such that he could detect in a moment what note was struck, and in what key the music was composed. When only 22, C.'s abilities were so much appreciated that he was appointed Professor of Music in Oxford University, the degree of Doctor of Music being conferred upon him. In 1822, he obtained the principalship of the Royal Academy of Music. C. composed a large number of pieces for the organ and piano, as well as many vocal pieces. He was author of *Elements of Musical Composition and Thorough Bass*, and *Styles of Music of all Ages*, 3 vols. He died December 29, 1847.

CRO'TCHET. See MUSIC.

CRO'TON, a genus of plants of the natural order *Euphorbiaceæ*, having male and female flowers generally on the same plant; the male flowers with five petals; the female flowers with three styles, which are either forked or divided into many branches; the capsules 3-celled, with one seed in each cell. The species are numerous, mostly tropical or sub-tropical trees or shrubs, a few herbaceous. Some of them possess in a very high degree the acrid properties so characteristic of the order to which they belong. Among these, the most important is the PURGING C. (*C. Tiglium*), a small tree, a native of India and the more easterly tropical parts of Asia. The leaves are extremely acrid; the wood in a fresh state is a drastic, and in a dried state, a more mild purgative; and the seeds (*C. Seeds*, or *Tilly Seeds*) are an extremely powerful drastic purgative, formerly much employed in Europe, but latterly disused on account of violence and uncertainty of action, although still valuable as yielding C. OIL (q. v.). They are oval, or oval-oblong, about the size of field-beans. So great is their acridity, that dangerous effects have ensued from working for some hours with packages of them. The oil is obtained mostly by expression, and partly by treating the cake with alcohol.—The wood and seeds of *C. Pavana* are employed in some parts of the East in the same way as those of *C. Tiglium;* and the wood is supposed to be the *Lignum Pavanæ* or *Panavæ* of commerce. Other species possess similiar properties.—Very different are the properties of the species which yield Cascarilla (q. v.) and Copalche (q. v.) barks, to which a great resemblance exists in the barks of a number of species, natives chiefly of America.—Other species are still more aromatic, and some delightfully fragrant, containing in great abundance a thickish balsamic sap. The sap of *C. gratissimus* is much employed as a perfume and cosmetic at the Cape of Good Hope; that of *C. origanifolium* is used in the West Indies as a substitute for Balsam of Copaiva; that of *C. balsamiferum*, also West Indian, furnishes *Eau de Mantes* by distillation; and the balsamic sap of some South American species is dried and used as incense.

CROTON A'QUEDUCT. See AQUEDUCT.

CROTON OIL is of an unctuous consistence, and varies in color from a pale yellow to a dark reddish-brown or deep sherry color. It is not miscible with water, but dissolves in alcohol and in ether. It has an acrid taste, and an unpleasant but characteristic odor, and is a powerful purgative, one drop of the pure oil being a sufficient dose. When rubbed upon the skin, it produces rubefaction and pustular eruption, and thereby tends to relieve some affections of the internal organs. It is used either by itself in the unmixed state, or diluted with olive oil, soap liniment, alcohol, &c. It is not to be employed except with caution.

CROTON RIVER. See NEW YORK.

CROTO'PHAGA (Gr. tick-eater), a genus of birds of the order *Scansores*, or Climbers, allied to trogons and toucans, and of which some of the species are known by the names ANI and KEEL-BIRD, the former from their cry, the latter from the high, blade-like ridge which surmounts the short, much compressed, arched bill. The tail is fan-shaped. *C. Ani*, often called the SAVANNA BLACKBIRD, is common in the West Indies and warm parts of America, inhabiting savannas and open pastures, particularly those which are occupied by cattle or horses, and feeding chiefly

Savanna Blackbird (*Crotophaga Ani*).

on insects, partly also on berries. It uses the sharp ridge of the bill in opening out earth, dung, &c., in search of insect prey. It often perches on the backs of horses or cattle, to feed on ticks, and may be seen clinging to a cow's tail; the important service which it renders being apparently well appreciated.

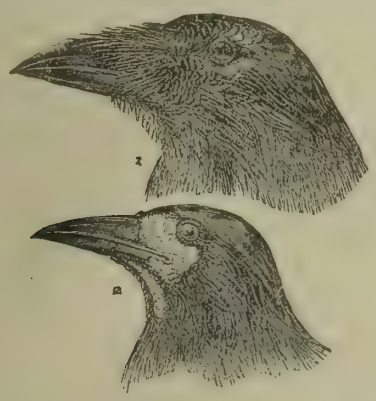
CROUP, a severe and fatal disease of infants, known from a remote period, but first scientifically described by Dr. Francis Home in 1765, as a suffocative affection of the breathing, depending upon the formation of a false membrane or fibrinous deposit on the mucous membrane of the windpipe or Larynx (q. v.). It is proper to remark that the inflammatory disease described by Home has been frequently confounded with a purely spasmodic affection of the larynx, the asthma of Millar, or *laryngismus stridulus* of Dr. Mason Good; and also with Diphtheria (q. v.), in which a false membrane is formed on the pharynx and palate, as well as in the larynx. C., in the more restricted sense, begins with symptoms resembling Catarrh (q. v.), but differing in the greater degree of feverishness and hoarseness.

In a short time, the respiration becomes difficult and noisy; a very peculiar hissing sound is heard accompanying the drawing of each breath; the cough is harsh and brassy; the countenance is injected, the expression very feverish and anxious, the voice entirely lost, or very much altered. This state is soon followed by one of suffocation, unless the little patient is relieved by expectoration, which, however, frequently takes place in the midst of vomiting or coughing, a quantity of membranous shreds being brought up from the windpipe along with glairy mucus, and sometimes streaks of blood. In the worst cases, the spasms of ineffectual coughing, and the constantly increasing obstruction to the breathing, are most painful to witness; and a period of tossing, extreme suffering, and anxiety is succeeded either by gradual insensibility, or by convulsions, which are very soon followed by death. True C. is rarely seen after the age of puberty, and is rather uncommon before the termination of the first year of life. It may occur, however, at any age, and has essentially the same characters as are above described. It is supposed to be due in some measure to Endemic (q. v.), and partly also to Epidemic (q. v.) causes. It is most common in cold and moist climates and seasons, and in low-lying, but exposed situations. The variations in its prevalence, however, are by no means fully explained. The treatment of C. requires to be very active and decided, and yet free from rashness. In cases of highly inflammatory type, and in robust children, it may be proper to take blood from the arm, or to place one or more leeches (according to the age of the child) over the top of the breast-bone. An emetic should also be given as soon as possible, composed of a full dose of tartar-emetic or of ipecacuanha, or both together. Some prefer sulphate of copper given in repeated doses: in America, a preference is given to alum and honey mixed into a paste, and given in teaspoonful doses. The emetic may be repeated, if necessary, every two or three hours, and the child should at intervals be placed in the warm bath. It needs hardly be added that medical advice should be procured without a moment's delay, whenever it is within reach, for the disease is one of extreme danger, and almost all the most effective remedies require experienced hands for their safe administration. In extreme cases, Tracheotomy (q. v.) has been resorted to with success.

CROW (*Corvus*), a genus of birds, the type of the family *Corvidæ* (q. v.). The largest species of this genus is the Raven (q. v.). The Rook (q. v.) also belongs to it. Besides these and the Jackdaw (q. v.), there are two other species found in Britain, the COMMON or CARRION C. (*C. corone*), and the ROYSTON C. or HOODED C. (*C. cornix*). They differ from one another chiefly in color,

the Carrion C. being black, the Hooded C. gray, with black head, throat, wings, and tail. The Hooded C. is also rather larger than the Carrion C., which, in size, nearly agrees with the rook, but which may readily be distinguished from that species by having the base of the bill and the upper part of the throat not naked and rough, but closely feathered.

The name Hooded C. is derived from the appearance of the black head, contrasted with the gray body, but in some parts of Scotland is, without any show of reason, popularly transferred to the Carrion C., under the form *Hoody*. Both of these species have habits much more resembling those of the raven than of the rook; they seldom or never associate in flocks, and not only prefer carrion to worms, insects, or vegetable food, but watch and attack very weak animals, such as young lambs. On this account, a premium is in many places given for their destruction, and gamekeepers relentlessly pursue them on account of their robbing nests, from which they take either the eggs or the helpless young. Their own nests are built in trees, or if these are not to be found, among high rocks. They both occasionally frequent the sea-coast, feeding on shell-fish, &c. Both are widely distributed over Europe and the



northern parts of Asia.—The C. of North America (*C. Americanus*) is very similar to the Carrion C., but rather smaller, and, after the breeding season is over, congregates into great flocks: it is also partially migratory, great numbers from the more northerly parts moving to the south on the approach of winter. Its habits are otherwise intermediate between those of the Carrion C. and the rook.—The FISH C. (*C. ossifragus*) frequents the coasts and southern rivers of the United States, feeding chiefly on fish, which it catches with great dexterity. It also sometimes assails gulls, and compels them to disgorge their prey.—The JABBERING C. (*C. Jamaicensis*) of the Blue Mountains of Jamaica is remarkable for the resemblance of its voice to human speech, which some of the other species of this genus, as the raven, it is well known, can be taught to imitate. Sir J. E. Tennent gives an interesting account of the small glossy C. of Ceylon (*C. splendens*), which frequents the towns, feeding on offal, and boldly entering rooms through open windows, to snatch some morsel from the dinner-table. Habits of pilfering are more or less prevalent among the different species of crow. The accompanying cut of the heads of the raven (fig. 1) and the rook (fig. 2) illustrates well the prevalent characters of the bill in this genus, showing also in the raven the bristles which, as in most of the species, surround its base, but which are wanting in the rook; and contrasting the greater strength of neck, head, and bill which belongs to the more carnivorous as compared with the more frugivorous species.—The RED-LEGGED C. is the CHOUGH (q. v.).—The name CARRION C. is given in America to the BLACK VULTURE. See VULTURE.—The PIPING C. of New South Wales is a BARITAH (q. v.).

CRO'WBERRY, or CRAKEBERRY (*Empetrumni grum*), a small procumbent shrub, of the natural order *Empetraceæ*, a native of the northern parts of the world, abundant in the moors of Scotland, and the north of England. The order consists of a few heath-like shrubs, which, however, are regarded as having a botanical affinity to *Euphorbiaceæ* (Spurges, &c.), with small unisexual flowers in the axils of the leaves, the fruit a small berry seated in the persistent calyx. The berries of the C. are nearly black, surround the branches in crowded clusters, and each contain 6—9

Crowberry:
b, fruit cut open; *c*, flower.

bony seeds and a watery acidulous juice, which is sometimes felt to be not unrefreshing; but they are generally little esteemed. A fermented or vinous liquor is prepared from them in some northern countries. They are a favorite food of game. *E. rubrum*, a native of the vicinity of Cape Horn, differs little from the northern plant, except in having red berries. The berries of the Camarinheira (*Corema alba*) are employed in Portugal for the preparation of an acidulous liquor, which is used as a drink in fevers.

CRO'WFOOT. See RANUNCULUS.

CRO'WLAND, or CROYLAND, an ancient town in the south of Lincolnshire, on the Welland, in a low flat district in the Fens, 48 miles south-south-east of Lincoln. There once existed here a large abbey, built about 1200, and there still exist the remains of a church founded by King Ethelwald in 716. At the confluence of the Welland and the Nene, there is a curious triangular bridge, built probably in the 14th c. on the site of an older one erected about 860. Ingulfus, the historian, was abbot of Croyland. Pop. (1871) 2459.

CROWN (Lat. *corona*, Wel. *crwn*, and Gael. *cruinn*, round). Crowns were originally garlands of leaves; and in this form they have probably been used as an ornament for the head by almost every people. They were much used by both the classical nations on joyous and on solemn occasions. Among the Greeks, the C. (*stephanos*) was sometimes used as an emblem of office, as in the case of the archons; sometimes as an ornament for the heads of the victors in the public games; and sometimes as a mark of distinction for citizens who had merited well of their country.

Corona Muralis.

Civic Crown.

Crowns of the latter class were made at first of twigs of laurel, but latterly of gold. The Romans made use of crowns to a greater extent than the Greeks, chiefly as rewards for valor. The most highly prized was the *Corona obsidionalis*, which was bestowed by a beleaguered garrison or army on the general who rescued them. It was made of grass or wild-flowers, gathered from the place which had been enclosed by the enemy. Next in order was the *Civic C.*, a garland of oak-leaves and acorns, which was given as a reward to any soldier who had saved the life of a Roman citizen in battle. For the soldier who wore it, a place next to the senators was reserved at the public spectacles, and both the senate and the assemblage rose up on his entrance. Not only he, but his father and paternal grandfather were free from all public burdens; and the person whose life he had saved was bound ever after to show him the duty which a son owes to a father. The civic C. is sometimes used in heraldry.

Another of the Roman crowns was the *Corona muralis*, which was bestowed on him who first scaled the wall of a besieged city. It was a golden ring surmounted with turrets or battlements. It is often used in modern heraldry.

The *Corona triumphalis*, which was of three kinds, was bestowed upon a general when he obtained a triumph.

But there was a totally different class of crowns, which were not honorary, but emblematical, and which were not regulated by law, like the former ones, but by custom. Of these, the most important were: 1. The *Corona sacerdotalis*, worn by the priests and bystanders when engaged in sacrifice, with the exception of the *pontifex maximus*. It was sometimes of olive leaves, sometimes of ears of corn, and sometimes of gold. 2. *Corona funebris* or *sepulchralis*, with which the dead was crowned, a custom which prevailed both among the Greeks and Romans. A law of the Twelve Tables provided that if any one had been crowned while living, the C. should be placed on his head when carried out to burial. Crowns were also placed on the bier, and scattered from the windows under which the procession passed. In Greece, these crowns were commonly of parsley. 3. *Corona convivialis*. The custom of wearing wreaths on festive occasions, which, like most of the Roman customs, was derived from Greece, is supposed to have originated in the habit of tying a woollen fillet round the head, to mitigate the effects of intoxication. As luxury increased, they were made of such flowers and shrubs as were supposed to prevent intoxication, roses, violets, myrtle, ivy, and even parsley. 4. *Corona nuptialis*, or bridal-wreath, made of flowers plucked by the bride herself, and not bought, which was of bad omen. Amongst the Romans, it was made of verbena. 5. *Corona natalitia*, a chaplet suspended over the door of the vestibule in which a child was born.

Several other classical crowns are mentioned in the very elabo-

rate article on the subject in Smith's *Dictionary*, to which we have been indebted for much of the preceding information.

As the emblem of sovereignty in modern Europe, the C. was borrowed rather from the Diadem (q. v.), than the crowns of antiquity. This decoration was originally Oriental. Alexander the Great adopted it from the kings of Persia; and Antony assumed it during his luxurious intercourse with Cleopatra. According to some, its adoption for the gods originated in the fillet, which was assigned to Bacchus for the purpose mentioned as that which led to the use of the convivial crown. In modern states, crowns were of very various forms, till heralds devised a regular series of them to mark the various gradations of sovereignty, from that of the emperor down to what are now called the coronets of counts and barons. The pope also had his triple crown. See TIARA. So entirely was the C. regarded as the symbol of sovereignty, that the word came often to be used as synonymous with the monarchy—a sense in which we still speak of the C. of England, and the domains and possessions of the crown.

The crowns of kings and emperors are closed above, whilst the coronet of a noble is merely an open circlet surrounding the head; hence, *to close the C.* has been the ambition of princes desirous of shaking off the authority of feudal superiors, and assuming a complete sovereignty.

The royal C. of Great Britain is a circle of gold enriched with stones and pearls, and heightened with four crosses pattée, and four fleurs-de-lis alternately. From these rise four arch-diadems, adorned with pearls, which close under a mound, ensigned with a cross pattée. The C. used at the coronation of Queen Victoria was adorned in accordance with the taste of the present time.

The coronet of the Prince of Wales is a circle of gold, set round with crosses pattée and fleurs-de-lis, but has only one arch, decorated with pearls, surmounted with a mound and cross, and bordered with ermine. In addition to his coronet, the Prince of Wales has a cognizance consisting of three ostrich feathers, argent, quilled or, enfiled with a prince's coronet of the last, with an escrol azure, whereon are the German words *Ich dien* (I serve). For the traditionary origin of this badge, see PRINCE OF WALES.

The younger sons and brothers of the sovereign wear as coronet a circle of gold, bordered ermine, heightened with fleurs-de-lis, crosses pattée, and strawberry leaves alternately. Nephews of the blood-royal have strawberry leaves on their coronets, where the sons and brothers have fleurs-de-lis. Princesses-royal have a circle of gold, bordered with ermine, and heightened with crosses pattée, fleurs-de-lis, and strawberry leaves alternately. For the coronets of the different orders of nobility, see their *titles*.

THE CROWN is a term often employed to signify the state, and the matters under control of the executive authority. Thus, in the interests of the state there are C. ministers, C. lawyers, C. officers, C. lands, &c.—the term, in no instance, having any special connection with the sovereign personally. In Scotland, certain high crimes are technically called Pleas of the Crown. These are four in number—murder, robbery, rape, and wilful fire-raising—and fall within the jurisdiction of the High Court of Justiciary. Likewise, in Scotland, there is a functionary styled C. agent. He is a practising law-agent or solicitor, who, under the Lord Advocate and his deputes, takes charge of criminal proceedings. His duty is to receive from the procurators-fiscal of the different counties the precognitions which they have taken, and to lay these precognitions before the lawyers for the crown, that they may determine whether there is ground sufficient to call for a prosecution. He also expedes indictments and criminal letters, and otherwise discharges the duties of an agent in preparing and assisting in the conduct of trials before the High Court of Justiciary, which are generally superintended or conducted by the Solicitor-general. The appointment of the C. A. is with the Lord Advocate, and ceases with the administration.

CROWN DEBTS. It is a prerogative of the crown to take precedence of all other creditors, and in England, to recover its debts by a summary process called an *extent*. By 33 Henry VIII. c. 39, this preference is given over all creditors who have not obtained judgment for their debts before the commencement of the crown's process; and the act 6 Anne, c. 26, extended the law of England in this respect to Scotland. The rule in Scotland, however, was limited to movable or personal property, and the crown has no privilege over a subject in a competition for heritage. It obtains, however, as opposed to the landlord's Hypothec (q. v.). Mercantile sequestration has no effect against the crown. The sanctuary of Holyrood House affords no protection to the king's debtor. See EXTENT, EXCHEQUER.

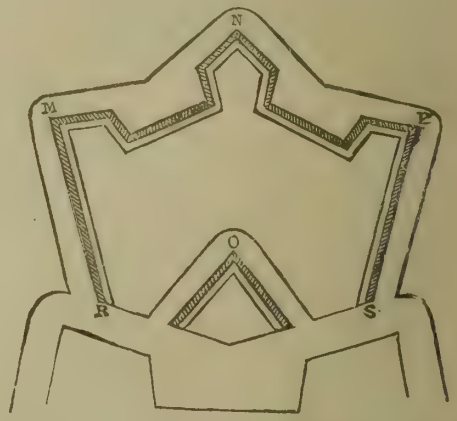
CROWN IMPE'RIAL. See FRITILLARY.

CROWN LANDS. The demesne lands of the crown are now contracted within narrow limits, having been almost entirely granted away to subjects. King William III. so impoverished the crown in this manner, that an act was passed, 1 Anne, c. 7, s. 5, the effect of which and of subsequent statutes is, that all grants or leases from the crown of royal manors, or other possessions connected with land, for a period exceeding 31 years, are void. At a much earlier period (1455, c. 41), a Scottish statute had rendered the consent of parliament necessary to the alienation of the property of the crown; but neither it, nor the subsequent statutes which were passed with a similar object, succeeded in checking the practice. The superintendence of such property as still belongs to the crown is now vested in commissioners appointed for the purpose, called the Commissioners of Woods, Forests, and Land Revenues. See WOODS AND FORESTS.

CROWN POINT, a post village in the state of New York, on the west side of Lake Champlain, about 75 miles north of Albany. Being within the basin of the St. Lawrence, it formed part of French Canada. With the view of bridling the English on the south, it was made the site of a fort famous in the American war, but of which the ruins only now remain. The immediate neighborhood is now a township of about 3000 inhabitants.

CROWN SOLICITOR, the solicitor to the Treasury, who, in state prosecutions in England, acts as solicitor for the crown in preparing the prosecution. In Ireland, there are crown solicitors attached to each circuit, whose duties correspond in some degree to those of the Procurators-fiscal (q. v.) and Crown Agent in Scotland. See CROWN. In England, there are no analogous officers, and prosecutions are consequently conducted by solicitors appointed either by the parish, or by private parties bound over by the magistrates to prosecute. But in cases of great importance to the public, such as unusual or monstrous crimes, it is of frequent occurrence that the Solicitor to the Treasury takes charge of the case and instructs counsel.

CROWN-WORK, in Fortification, is formed to strengthen a weak front, or to occupy ground which might facilitate the enemy's operations. It consists of two faces inclined to each other



at an angle, with a bastion in the middle, and half-bastions at the two ends; and it is connected with the main body of the work by two long sides. One form of C. is shown in the annexed cut, where RMNPS is the C., in front of and protecting the ravelin O. Both of these works are entirely beyond the main ditch of the place, but each has also a ditch of its own.

CROW'S-FEET, in Siege Operations. See CALTHROP.

CROW-STONE, the top stone of the gable-end of a building. See CORBIE STEPS.

CROY'DON (Fr. *croie dune*, chalk-hill), a town in the north-east of Surrey, on the London and Brighton Railway, 10¼ miles south of London Bridge. It lies on the edge of the chalk and plastic clay, near the Banstead Downs, at the source of the Wandle. C. was one of the first towns in England to grapple effectually with the question of the economical disposal of town-sewage. In 1868, owing to the rapid growth of the town, new waterworks were completed. The water, which is of great purity, is obtained from an Artesian well. There are 7 railway stations at C., from which about 200 trains are despatched daily. Pop. (1881) 78,947. The Archbishops of Canterbury had a palace here till 1750. This palace is now a factory, and the summer seat of the archbishops is now at Addington, 4 miles east of Croydon. About a mile from C. is Addiscombe House, at one time the residence of the first Earl of Liverpool, but purchased by the East India Company in 1809. When enlarged by other buildings, it became a Military Academy, at which cadets were educated for the artillery and engineer services of the Company. At a later date, the infantry cadets also received their professional education there. In 1858, when the government of India was transferred from the Company to the Crown, Addiscombe Academy was transferred in like manner, and became the Royal Military College. This college no

longer exists; the buildings were demolished in 1863; and the site has been covered with streets of villas. C. has one of the finest Gothic churches in the country.

CROZE'T ISLANDS, a volcanic group to the south of the Indian Ocean, lie between Kerguelen's Land on the east and Prince Edward's Islands on the west, about midway between Patagonia and New Zealand. The most easterly link of the chain is in lat. 46° 27′ S., and long. 52° 14′ E.

CRU'CIAN (*Cyprinus carassius*), a fish of the same genus with the Carp (q. v.) from which it differs in the want of barbules at the mouth, in the much greater depth of body, and in the almost square tail. It attains a considerable size. It inhabits lakes, ponds, and slowly flowing rivers, in the north of Europe and of Asia. It is called *Karussa* in Sweden. It exists in the Thames, although rare, and is called the *German Carp*, but has perhaps been introduced. It is an excellent article of food. The introduction of the C. into some of the waters of the northern parts of Britain seems particularly desirable.

Crucible.

CRU'CIBLES are vessels employed for the heating and fusing of glass, metallic ores, &c., and are generally made of materials capable of resisting high temperatures, such as fire-clay, black-lead, porcelain, platinum, and silver.

CRU'CIFIX (Lat. *crux*, the cross, and *figo*, I fix), a cross with the effigy of Christ fixed on it. The principal C. in Roman Catholic churches stands in the center of the high-altar. It overtops the tapers, and is only removed at the elevation of the host. In well-appointed churches, the altar crucifix is generally either of gold or silver. Crucifixes are used in Lutheran churches, and in Prussia they are often made of Berlin iron. The C. first began to take the place of the plain cross in the time of Constantine, but it was never publicly acknowledged by the Greek Church, and did not come into general use in the East till towards the end of the 8th century. It was not till the Carlovingian age that it became general in the Latin Church. On the earlier crucifixes, Christ is represented as alive, with open eyes, and generally clad, and fastened with four, not three nails. We offer a representation of an ancient form of C., with the body of Christ clothed, and four nails as fastenings, also the glory or nimbus round the head.—Fairholt's *Dictionary of Terms of Art*. In later times, all these circumstances varied. Christ was often represented as dead, naked, except a cloth round the loins, and fastened with three nails; i. e., the two feet fastened together by one nail. The earlier artists usually represented the figure of Christ as haggard, and his countenance as sorrowful to the last degree; but latterly the custom was introduced of representing him as the ideal of human beauty, and of throwing into his countenance an expression of rapture and heavenly joy. See CROSS.

CRUCI'FERÆ (Lat. cross-carrying), an important natural order of exogenous plants, including about 1600 known species, and corresponding to the class *Tetradynamia* of the Linnæan system. See BOTANY. The flowers have a calyx of four sepals, which fall off after flowering; and a corolla of four petals, which are placed in the form of a cross—whence the name C.—and alternate with the sepals. There are six stamens; four long ones in opposite pairs, and two short ones between the pairs of long ones. The ovary is superior and there are two stigmas. The fruit is either long and podlike (a *silique*), or a short and roundish *pouch* (*silicule*); one-celled or (usually) spuriously two-celled, by the parietal placentæ (see PLACENTA) meeting in the middle, and forming a kind of Dissepiment (q. v.); and contains either one seed, or many in a single row. Linnæus divided his class *Tetradynamia* into the orders *Siliquosa* and *Siliculosa*, according to the form of the fruit, and these may also be regarded as forming sub-orders of this natural order; but another division has more recently been adopted, founded on the character of the Cotyledons (q. v.); and the manner in which the radicle is folded upon them (cotyledons *accumbent*, *incumbent*, or *conduplicate*). The general character of the order is antiscorbutic and stimulant, with more or less acridity. It contains many plants extensively cultivated for the food of man and of domestic animals, or valuable in medicine, as Kale (Cabbage, Cauliflower, Broccoli, Colewort, &c.), Turnip, Rape, Radish, Cress, Horse-radish, Scurvy Grass, Mustard, Sea-kale, Gold of Pleasure, &c. The dye-stuff called Woad is produced by a plant of this order. It includes also a number of garden-flowers highly esteemed for their beauty and fragrance, as Wallflower, Stock, Rocket, &c.

The pungency and acridity of the C. seems to depend on a volatile oil, or on different volatile oils of very similar character, present in very various degree in different species, or in the same species under different circumstances, and in different parts of the same plant. This diversity is very well illustrated in the common turnip; in the different qualities of the root, as to sweetness and acridity, in different soils or seasons, and in the difference between the flesh and the rind. The seeds of the C. contain a fixed oil, which is extracted from some (Rape, Colza, in Europe; *Myagrum sativum* and *Erysimum perfoliatum* in Japan), to be used as a lamp-oil and in the arts, and the oil-cake is valuable for feeding cattle. The plants of this order belong mostly to the temperate parts of the world, and particularly abound in Europe. Comparatively few are found within the tropics.

CRU'DEN, ALEXANDER, was born at Aberdeen, 31st May 1700, and educated at Marischal College, with a view to the church, but having exhibited decided symptoms of insanity, he was for some time placed in confinement. On his release, he left Aberdeen, and after spending several years as a tutor, settled in London in 1732, first as a corrector of the press, and afterwards as a bookseller. In 1737, appeared his *Complete Concordance of the Holy Scriptures of the Old and New Testament*, a really great work, which has laid divines especially under deep obligations to the laborious author. The book was dedicated to Queen Caroline, who graciously promised to 'remember him,' but unfortunately died a few days after. C. now relapsed into insanity, and his friends were obliged to remove him to a private asylum, where he appears to have been harshly treated. On his recovery, he published an account of his sufferings. For the next fifteen years he acted as a corrector of the press, but, in 1753, he had again to be put under restraint, but only for a few days. C. now believed himself divinely commissioned to reform the manners of the world, and styled himself Alexander, *the Corrector*. He went about the country exhorting the people to keep holy the Sabbath day, &c. He also petitioned the king for the honor of knighthood, and the parliament to constitute him by act, 'the Corrector of the People,' hoping by such honors to influence the people more effectually. Several other foolish things were done by C. in the course of his life, but he also performed many virtuous and benevolent actions which shed a pleasing light over his melancholy career. C. died at Islington, November 1, 1770. There have been many editions and abridgments of C.'s Concordance published both in Britain and America. One of the best known is that of Chalmers (London, 1812; 10th ed. 1824).

CRUI'KSHANK, GEORGE, one of the most gifted of English pictorial satirists, was born in London, Sept. 27, 1792. His father was a native of Aberdeenshire, and the son of a person who had fought for Prince Charles Stuart at Culloden. C. at first thought of the stage as a profession; but some of his sketches having come under the notice of a publisher, he was induced to engage in the illustration of children's books and songs. When about twenty years of age, a publication, called *The Scourge*, afforded scope for the display of his satiric genius, and from that time forth he continued to pursue with remarkable success this his true vein. His illustrations for Mr. William Hone's political squibs and pamphlets attracted much attention, and sent some of them through no less than fifty editions. But these political caricatures, many of which were personal, were not altogether to C.'s taste. Nor, indeed, in this narrow party field did he find verge enough for the full exhibition of his rich fund of humor and the depths of moral sarcasm.

He consequently abandoned this style about 1824. In *Points of Humor*, and the designs for *Grimm's German Tales*, *Tom Thumb*, *Peter Schlemihl*, *Punch and Judy*, *My Sketch-book*, *Boz*, *Oliver Twist*, and the *Comic Almanac*, his comic genius first found ample manifestation; while in his *Sunday in London*, his *Gin-shop*, *The Upas Tree*, and especially *The Bottle*, he showed himself a moral teacher possessed of a grim Hogarthian earnestness and force. *The Bottle* consisted of a series of eight large-sized plates representing the various stages in a drunkard's career; and through temperance societies, and its own merits, the work has had an enormous circulation. As a water-colorist he left work marked by masterly and delicate skill. In his late years C. devoted himself to oil-painting, and in this province showed perhaps more humor, fervour, and inventive ability than artistic power (see his *Life* by Blanchard Jerrold, 1882). Several of his oil-paintings have been popular and have been engraved—as 'A Run-away Knock,' 'Disturbing the Congregation,' and 'The Worship of Bacchus.' The list of his works amounts to 5500. He died 1st February 1878.

CRUI'SER is a small war-vessel, employed chiefly in watching an enemy by sailing about in a suspected latitude, or in any other defined portion of sea.

CRUITHNE' (Lat. *Cruithnii*, *Cruthini*), the name given, from the 6th to the 9th c., to a people who inhabited the southern half of the county of Antrim, and the greater part of the county of Down, and at one time established themselves also in the county of Meath, in Ireland. They were otherwise called Dalaradians, and their country, Dalaradia. Their name of C. is supposed to be derived from the Celtic *cruit*, color, and to have been applied to them because they painted or tattooed their skins. It is the name by which the Irish called the Picts of Britain, of whom, indeed, the Irish C. are believed to have been a branch. See DALARADIA and PICTS.

CRUIVES AND ZAIRES are contrivances erected upon rivers in Scotland for the purpose of catching salmon. They are of great antiquity, and consisted of a 'kind of hedge formed by stakes driven into the ground, the interstices being filled with brush, and the mode of catching salmon being similar to those employed by bag and stake nets;' the earliest statute now in force, the 11th of the first parliament of James I. (1424), being entitled, 'Of Cruives, Zaires, and Satterdaies Slop.' This act is interpreted by 1477, c. 73, 'Anent cruives,' and both acts refer to an 'old statute made by King David,' requiring that 'ilk heck of the foresaidis cruves be three inch wide.' The existing arrangement, by which the stakes or hecks which prevent the passage of the larger fish must be so far apart as to permit the young salmon or fry to pass through freely, is thus as old as the time of the great founder of our Scottish monasteries and cathedrals. The Saturday's slop or opening is effected by drawing up the hecks to the height of an ell from the bottom of the river in which position they must remain from Saturday evening at sunset till Monday morning at sunrise. C. and Z. are prohibited in those parts of the river in which the tide ebbs and flows. The Fisheries Act of 1862 left the law regarding C. untouched. See SALMON.

CRUSA'DES is the name given to the religious wars carried on during the middle ages between the Christian nations of the West and the Mohammedans. The first of these was undertaken simply to vindicate the *right* of Christian pilgrims to visit the Holy Sepulchre. On the conquest of Palestine, however, the *object* of the C. changed, or at least enlarged, and the efforts of the subsequent crusaders were directed to the rescue of the whole land from the Saracens, who had repossessed themselves of it. From an early period in the history of the Church, it was considered a pious act to make a pilgrimage to the Holy Sepulchre, and to visit the various spots which the Saviour had consecrated by his presence. When Palestine was conquered by the Arabs in the 7th c., that fierce but generous people respected the religious spirit of the pilgrims, and allowed them to build a church and a hospital in Jerusalem. Under the Fatimides of Egypt, who conquered Syria about 980 A.D., the position both of the native Christian residents and of the pilgrims became less favorable; but the subjugation of the country, in 1065, by brutal hordes of Seljuk Turks from the Caucasus rendered it intolerable. These barbarians, but recently converted to Mohammedanism, were nearly as ignorant of the Koran as of the Scriptures. They hardly knew their fellow-religionists, and are said to have wreaked their vengeance on the Mussulmans of Syria, as well as on the Christians. The news of their atrocities produced a deep sensation over the whole of Christendom. The first to take alarm were, naturally enough, the Byzantine monarchs. In 1073, the Greek emperor, Manuel VII., sent to supplicate the assistance of the great pope, Gregory VII., against the Turks, acompanying his petition with many expressions of profound respect for his Holiness and the Latin Church. Gregory—who beheld in the supplication of Manuel a grand opportunity for realizing the Catholic unity of Christendom—cordially responded; but circumstances prevented him from ever carrying the vast designs which he entertained into execution, and the idea of a crusade died gradually away. It was, however, revived by his successor, Urban II., an able and humane man, whose sympathies were kindled by the burning zeal of Peter the Hermit, a native of Amiens, in France, who had made a pilgrimage to the Holy Land, witnessed the cruelties perpetrated by the Turks, and was now traversing Europe, preaching everywhere to crowds in the open air, and producing the most extraordinary enthusiasm by his impassioned descriptions of how pilgrims were murdered, robbed, or beaten, how shrines and holy places were desecrated, and how nothing but greed restrained the ruffian Turks (who made the Christians pay heavy taxes for their visits to Jerusalem) from destroying the Holy Sepulchre, and extirpating every vestige of Christianity in the land.

As soon as the feelings of Europe had been sufficiently heated, Urban openly took up the question. Two councils were held in 1095. At the second, held at Clermont, in France, a crusade was definitely resolved on. The pope himself delivered a stirring address to a vast multitude of clergy and laymen, and as he proceeded, the pent-up emotions of the crowd burst forth, and cries of *Deus vult* (God wills it) rose simultaneously from the whole audience. These words, *Deus vult*, by the injunction of Urban, were made the war-cry of the enterprise, and every one that embarked in it wore, as a badge, the sign of the cross; hence the name *Crusade* (Fr. *croisade*, from Lat. *crux*, a cross).

First Crusade.—From all parts of Europe, thousands upon thousands hurried at the summons of the pope to engage in the holy war. 'The most distant islands and savage countries,' says William of Malmesbury, 'were inspired with this ardent passion. The Welshman left his hunting, the Scotchman his fellowship with vermin, the Dane his drinking-party, the Norwegian his raw fish.' It is said that in the spring of 1096 not less than 6,000,000 souls were in motion towards Palestine. This, however, must be a huge exaggeration. What we do know positively is, that previous to the setting out of the great hosts of European chivalry, four armies—if disorderly and anarchic multitudes, the mere dregs and refuse of Christendom, deserve that name—amounting in all to 275,000 persons, had departed for Palestine. The first consisted of 20,000 foot, and was commanded by a Burgundian gentleman, Walter the Penniless. It marched through Hungary, but was cut to pieces by the natives of Bulgaria, only a few, among whom was Walter himself, escaping to Constantinople. The second, consisting of 40,000 men, women, and children, was led by Peter the Hermit. It followed the same route as its predecessor, and reached Constantinople greatly reduced. Here the two united, crossed the Bosporus, and were utterly defeated by the Turks at Nice, the capital of Bithynia. A third expedition of a similar kind, composed of 15,000 Germans, led by a priest named Gottschalk, was slaughtered or dispersed in Hungary; which also proved the grave of the *fourth*, a terrible horde, consisting of about 200,000 wretches from France, England, Flanders, and Lorraine, who had swept along through Germany, committing horrible ravages, especially against the Jews, whom they murdered without mercy. *Now*, however, the real crusaders made their appearance: the gentry, the yeomanry, and the serfs of feudal Europe, under chiefs of the first rank and renown. Six armies appeared in the field, marching separately, and at considerable intervals of time. Their respective leaders were Godfrey of Bouillon, Duke of Lorraine; Hugh the Great, Count of Vermandois, and brother of Philippe, king of France; Robert Curthose, Duke of Normandy, the son of William the Conqueror; Count Robert of Flanders; Bohemond, Prince of Tarentum, son of the famous Guiscard, under whom was Tancred, the favorite hero of all the historians of the crusade; and lastly, Count Raymond of Toulouse.

The place of rendezvous was Constantinople. The Greek emperor, Alexius, afraid that so magnificent a host—there were in all not less than 600,000 men, exclusive of women and priests—might be induced to conquer lands for *themselves*, cajoled all the leaders, excepting Tancred and Count Raymond—into solemnly acknowledging themselves his liegemen. After some time spent in feasting, the crusaders crossed into Asia Minor (accompanied by the unfortunate Peter the Hermit). Here their first step was the siege and capture of Nice, the capital of Sultan Soliman, 24th June 1097. This monarch was also defeated by Bohemond, Tancred, and Godfrey, at Dorylæum. Baldwin, brother of Godfrey, now crossed into Mesopotamia, where he obtained the principality of Edessa. After some time, the crusaders reached Syria, and laid siege to Antioch. For seven months the city held out, and the ranks of the besiegers were fearfully thinned by famine and disease. Many even brave warriors lost heart, and began to desert. Melancholy to relate, among the list of cowards was the poor enthusiast who had planned the enterprise. Peter was actually several miles on his way home when he was overtaken by the soldiers of Tancred, and brought back to undergo a public reprimand. At length, on the 3d of June 1098, Antioch was taken, and the inhabitants were massacred by the infuriated crusaders, who were in their turn besieged by an army of 200.000 Mohammedans sent by the Persian sultan. Once more famine and pestilence did their deadly work. Multitudes also deserted, and escaping over the walls, carried the news of the sad condition of the Christians back to Europe. But again victory crowned the efforts of the besieged. On the 28th June 1098, the Mohammedans were utterly routed, and the way to Jerusalem opened. It was on a bright summer morning (1099) that 40,000 crusaders, the miserable remnant of that vast array which two years before had laid siege to Nice, obtained their first glimpse of Jerusalem. The emotion was intense, the scene sublime. On the 15th of July, after a siege of rather more than five weeks, the grand object of the expedition was realized. Jerusalem was delivered from the hands of the infidel. Eight days after the capture of the city Godfrey of Bouillon was unanimously elected king of Jerusalem. His kingdom, at first comprising little more than the mere city of Jerusalem, was gradually extended by conquest until it included the whole of Palestine. A language resembling Norman French was established, a code of feudal laws drawn up—Jerusalem was erected into a patriarchate, and Bethlehem into

a bishopric. The best part of Asia Minor was restored to the Greek empire, while Bohemond became Prince of Antioch. For nearly fifty years, the three Latin principalities or kingdoms of the East—Edessa, Antioch, and Jerusalem—not only maintained themselves against the attacks of the Mohammedans of Egypt and Syria, but greatly increased in size, power, and wealth. At Jerusalem were founded the two famous orders of the Knights Hospitallers of St. John and the Knights Templars.

Second Crusade.—In 1144, the principality of Edessa was conquered by the Emir of Mosul, and the Christians slaughtered. His son, Noureddin, advanced to destroy the Latin kingdom of Syria, and Palestine. Europe once more trembled with excitement. A second crusade was preached by the famous St. Bernard, Abbott of Clairvaux, in Champagne; and early in 1147 two enormous armies, under the command of Louis VII., king of France, and Conrad III., emperor of Germany, marched for the Holy Land. Their united numbers were estimated at 1,200,000 fighting-men. The expedition, nevertheless, proved a total failure. The Greek emperor, Manuel Commenus, was hostile; and through the treachery of his emissaries, the army of Conrad was all but destroyed by the Turks near Iconium, while that of Louis was wrecked in the defiles of the Pisidian mountains. After a vain attempt to reduce Damascus, the relics of this mighty host returned to Europe.

Third Crusade.—The death-blow, however, to the kingdom of Jerusalem, and the power of the crusaders, was given, not by Noureddin, but by Salah-Eddin, commonly called Saladin, a young Kurdish chief, who had made himself sultan of Egypt, and who aspired to the presidency of the Mohammedan world. He invaded Palestine, took town after town, and finally, in October 1187, compelled Jerusalem itself to capitulate, after a siege of fourteen days. The news of this led to a third crusade, the chiefs of which were Frederick I. (Barbarossa), emperor of Germany, Philippe Auguste, king of France, and Richard *Cœur-de-Lion*, king of England. Barbarossa took the field first in the spring of 1189, but accidentally lost his life by fever caught from bathing in the Orontes. His army, much reduced, joined the forces of the other two monarchs before Acre, which important city was immediately besieged. In vain did Saladin attempt to relieve the defenders; and after a beleaguerment of twenty-three months, the place surrendered. But the crusaders were not united among themselves. Philippe soon after returned to France; and Richard, after accomplishing prodigies of valor, which excited the admiration of the Saracens, concluded a treaty with Saladin, by which 'the people of the West were to be at liberty to make pilgrimages to Jerusalem, exempt from the taxes which the Saracen princes had in former times imposed.' This, as has been previously noticed, was *all* that had been claimed by the *first* crusaders. On the 25th of October 1192, Richard set sail for Europe.

Fourth Crusade.—Crusading unfortunately now became a constituent of the papal policy; and in 1203 a fourth expedition was determined upon by Pope Innocent III., although the condition of the Christians was by no means such as to call for it. It assembled at Venice; but how entirely secular crusading had become, will be seen from the fact, that the army never went to Palestine at all, but preferred to take possession of the Byzantine empire. The leader of this host of *pseudo-crusaders*, Baldwin, Count of Flanders, was seated on the throne of the East in 1204, where he and his successors maintained themselves for fifty-six years.

Fifth Crusade.—This was commanded by Frederick II., emperor of Germany. It began in 1228, and terminated in a treaty between that monarch and the sultan of Egypt, by which Palestine was ceded to Frederick, who, being crowned king of Jerusalem, returned to Europe, leaving his new possessions in a state of tranquility.

Sixth Crusade.—In 1244, a new race of Turks burst into Syria, and once more the Holy Land fell into the hands of these ferocious barbarians. Jerusalem was burned and pillaged. In 1249, Louis IX. of France (St. Louis) headed a crusade against them, but was utterly defeated, and taken prisoner by the sultan of Egypt. By the payment of a large ransom he obtained his liberty, and that of the other prisoners. On his return to Europe, he was regarded as a sort of martyr in the cause of Christ.

Seventh Crusade.—This also was primarily undertaken by St. Louis, but he having died at Tunis in 1270, on his way to Palestine, Prince Edward of England, afterwards Edward I., who had originally intended to place himself under the command of St. Louis, marched direct for Palestine, where his rank and reputation in arms gathered round him all who were willing to fight for the cross. Nothing of consequence, however, was accomplished; and Edward soon returned to England, the last of the crusaders. Acre, Antioch, and Tripoli still continued in the possession of the Christians, and were defended for some time by the Templars and other military knights; but in 1291 Acre capitulated, the other towns soon followed its example, and the knights were glad to quit the country, and disperse themselves over Europe in quest of new employment, leaving Palestine to the undisturbed possession of the Saracens.

Effects of the Crusades.—While we cannot help deploring the enormous expenditure of human life which the C. occasioned, it is impossible to overlook the fact that they indirectly exercised a most beneficial influence on modern society. They secured for humanity certain advantages which it is difficult to see could have been otherwise obtained. M. Guizot, in his *Lectures on European Civilization*, endeavors to show their design and function in the destinies of Christendom. 'To the first chroniclers,' he says, 'and consequently to the first crusaders, of whom they are but the expression, Mohammedans are objects only of hatred; it is evident that those who speak of them do not know them. The historians of the later crusades speak quite differently: it is clear that they look upon them no longer as monsters; that they have to a certain extent entered into their ideas; that they have lived with them; and that relations, and even a sort of sympathy, have been established between them.' Thus the minds of both, but particularly of the crusaders, were partly delivered from those prejudices which are the offspring of ignorance. 'A step was taken towards the enfranchisement of the human mind.'

Secondly, the crusaders were brought into contact with two civilizations, richer and more advanced than their own—the Greek and the Saracenic; and it is beyond all question that they were mightily struck with the wealth and comparative refinement of the East. Thirdly, the close relationship between the chief laymen of the West and the church, occasioned by the C., enabled the former 'to inspect more narrowly the policy and motives of the papal court.' The result was very disastrous to that spirit of veneration and belief on which the church lives, and in many cases an extraordinary freedom of judgment and hardihood of opinion were induced—such as Europe had never before dreamed of. Fourthly, great social changes were brought about. A commerce between the East and West sprang up, and towns—the early homes of liberty in Europe—began to grow great and powerful. The C., indeed, 'gave maritime commerce the strongest impulse it had ever received.' The united effect of these things, again, in predisposing the minds of men for a reformation in religion, has often been noticed. Other causes undoubtedly co-operated, and in a more direct and decisive manner, but the influence of the C. in procuring an audience for Luther, cannot be overlooked by the philosophic historian.

CRUSCA, ACADEMIA DELLA. See ACADEMY.

CRUSHERS, or BRUISERS, are implements used for reducing to small fragments corn, beans, linseed, oil-cake, and other similar hard food of horses, oxen, or hogs, in order that it may be more thoroughly subjected to the action of the gastric juice, and that no part of it may pass through the animal undigested. Seeds which enter the stomach with their husk or outer pellicle unbroken, often resist its powers, so that they contribute nothing to nourishment; and this is the case to a very large extent with corn given to old horses; but mastication is never so perfect, however good may be the condition of an animal's teeth, that the previous crushing of hard food will not be found useful. C. are of different kinds, and those intended for oil-cake are somewhat different from those suitable for grain; but the essential part generally consists of toothed, grooved, or otherwise roughened cylinders, revolving so as to bruise the food either against each other, or against a fixed plate of similar roughness.—CLOD-CRUSHER is the name of an agricultural implement, which may be generally described as a toothed or roughened roller; and will be found noticed, with its uses, in the article ROLLER.

CRUST OF THE EARTH. It having once been believed by geologists that the interior of our globe is in a state of fusion from heat, they have given the name of crust of the earth to the external solid covering. Man has been able to penetrate but a short way into the crust, and he cannot safely reason on his observations made at or near the surface, regarding the condition of the crust to a greater depth than a few miles, at the most ten—all beyond is little more than guess-work. The materials of the crust are not thrown confusedly together, but distinct mineral masses are found to occupy definite spaces, or to exhibit a certain order of arrangement. These may be classified in reference to their origin, as Aqueous or Igneous; or to their age, as Primary, Secondary, and Tertiary. See these heads, and REFRIGERATION OF THE EARTH; also Fisher's *Physics of the Earth's Crust* (1882).

CRUSTA'CEANS (*Crustacea*), a class of articulated animals, agreeing with insects, arachnida, and myriapoda in having articulated limbs; but differing from them in important respects, and particularly from all of them in the adaptation of the organs of respiration to an aquatic life, even those of them which live on land being generally inhabitants of damp places, and breathing by a kind of gills. Some of the lowest and minute aquatic C., indeed, are not provided with gills; but the aëration of the blood is supposed to take place through the surface of the body.

The C. derive their name from the hard armor which in most of them covers the whole body, forming for it that sort of framework

which is sometimes, not very correctly, called an external skeleton; and which, in those of highest organization, is very complex in its structure, and contains a large amount of calcareous matter —carbonate and phosphate of lime, so that it is in its substance intermediate between shell and bone—whilst in many of the lower and smaller kinds it consists principally of *chitine*, and corresponds more nearly in its nature with the integuments of insects. The body of a crustacean is composed of rings (see ARTICULATA), generally twenty-one in number, and the crustaceous covering corresponds with it in this respect; the rings, alike of the body and its armor, being in some cases very distinct, whilst in others some of them in a great measure coalesce or are consolidated together, of which the thorax of a crab affords an excellent example. The first seven rings are regarded as forming the head; the next seven, the thorax; and the remainder the abdomen, corresponding with the head, thorax, and abdomen of insects. The crustaceous covering is considered as a peculiar epidermis, having beneath it a true skin, from which it is an inorganic exudation; and, like the epidermis, it is cast off from time to time, that its place may be supplied anew, as the growth of the animal requires more room for the internal soft parts. In this *moulting*, or casting of the shell, the animal divests itself of its covering not in separate parts, but in one piece, including the coverings of the limbs, and even of the antennæ, although the membranes which connect the hard plates are split and torn.

A period of apparent sickness precedes and agitation accompanies the process; and the thick muscular parts of the limbs of crabs and lobsters become soft and flaccid, so as to be much more easily extricated from their hard coverings. The loss of a limb, which sometimes takes place on such an occasion, and is otherwise a frequent occurrence, is easily repaired, for a new one grows in its stead; but it is a curious circumstance that in order to this reproduction, the limb must be broken off at a particular joint, the second from the body, thus leaving only a short stump; and when a limb is broken elsewhere, the animal exercises the remarkable power of throwing it off by this joint.

The principal organ of locomotion in many C., as in the lobster, shrimp, &c., is the abdomen, terminating in fan-like appendages; by bending the abdomen suddenly down under the thorax, they dart *backwards* in the water. The limbs—which are connected with the thoracic rings—are, in some, organs of swimming; those of others are used for walking at the bottom of the water or on dry ground. Some have what are called *false legs* or *pro-legs* attached to the abdomen, often very different from the thoracic legs. The legs of some are fitted for burrowing. The first pair of legs is not unfrequently transformed into a pair of powerful claws or pincers —the last joint but one being prolonged so as to oppose the last joint, which becomes attached as to the side of it; and these are used for seizing and tearing food. The limbs of the first thoracic rings are, in many C., organs still more intimately connected with the mouth, and have received the name of foot-jaws, the transition from the true mandibles and maxillæ to the organs of locomotion being often very gradual. The mouth of some small parasitic C. is, however, formed for sucking, and not for tearing and masticating food. The digestive organs are very simple in all; there is a short but capacious gullet, a large stomach, and a straight and simple intestinal tube. The pyloric region of the stomach, however, is furnished with a remarkable apparatus of hard tubercles or sharp teeth for grinding or tearing food, supplementary to the external organs of the mouth. Almost all of the C. feed on animal food, and they are very voracious. A few feed on vegetable food. The nervous system of C. agrees generally with that of insects, and exhibits many gradations of division and concentration. C., in general, appear to possess all the five senses. Their eyes are either simple (stemmatic) aggregate (consisting of several stemmata under a common cornea), or compound. The compound eyes are often on foot-stalks. The gills are variously placed; in the internal cavity, under the *carapace*—the enlargement of the plate of a single ring, which covers the thoracic rings in crabs, &c.; on the thoracic limbs; on the abdominal or false legs, &c. The heart is always in the middle line, and distributes the blood by arteries through the system; but the blood returns to venous *sinuses*, from which it is sent into the gills, and thence to the heart again. The sexes are distinct in most of the C.; and they are all oviparous.

The Crustacea are one of the most instructive of all groups to the comparative anatomist, on account of the extraordinary degree of differentiation, sometimes progressive, sometimes retrogressive—which they exhibit from the primitive segmented type. Their development is if possible even more remarkable, frequently exhibiting a series of metamorphoses rivaling in completeness those of insects, almost in all cases leading back to a single primitive unsegmented six-limbed form, the *Nauplius* embryo (fig. 1), and furnishing the ultimate key to the affinities of the group. Thus the free-swimming copepod cyclops and its numerous parasitic relatives, the branchiopods, the 'multivalve' cirripedes, and barnacles, the ancient Silurian trilobites, and even some of the highest forms (Decapoda), leave the egg as nauplius. The prawn *Penæus* leaves the egg as a *nauplius*, molts into a *cyclops* form, thence into a *schizopod* stage, and finally assumes its adult state; while the crab quits the egg in a *cyclops* state. The so-called *Zoea*,

Metamorphoses of the Crab:
1, young crab, or *Zoea*, magnified; 2, young crab, in prawn stage, magnified; 3, prawn stage, natural size; 4, young crab, in more perfect form, magnified; 5, young crab, natural size.

fig. 1, thence passes at once into the prawn stage, fig. 2, and finally into the adult form, the developmental history being here much more condensed.

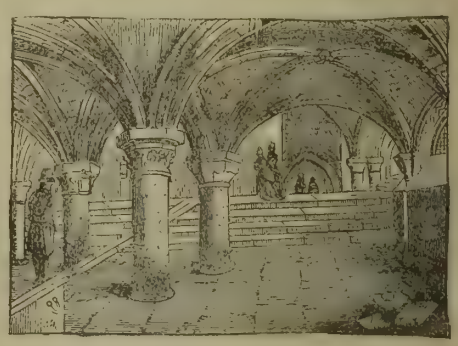
The great majority of C. are marine; some belong to fresh water and a few are terrestrial. For an outline of the classification of the group, See ZOOLOGY (under Arthropoda), also articles on CRAB, LOBSTER, CRAYFISH; and Huxley, *The Crayfish;* (Int. Sci. Series); Huxley, *Anat. of Invert. Animals;* and Muller, *Facts and Arguments for Darwin.*

CRUYS, CORNELIS, the founder of Russian maritime power, was born June 14, 1657. He was a rear-admiral in the Dutch service, when, in 1698, Peter the Great persuaded him to become vice-admiral in Russia. To C. Russia owed its first dockyards, canals, and charts, the organization of its navy, and its victories over Sweden and Turkey in 1708—1710. After a short period of disgrace, C. was received back to favor. He died in 1727, possessor of an imperial domain in Kexholm, and owner of the island Biiken in Finland.

CRY'OLITE is a double fluoride of aluminium and sodium (NaF,Al_2F_3), and is important as a source of the metal Aluminium (q. v.).

CRYO'PHORUS (Gr. *kryos*, cold, and *phero*, I carry) is an instrument consisting of a glass tube with a bulb at both ends. A little water is present in one of the bulbs, and when the second bulb, containing only water-vapor, is placed in a freezing mixture, the vapor condenses, which causes more vapor to rise from the water in the first bulb. The result of this vaporation from the first bulb is the abstraction of much heat, and ultimately the remaining water passes into a frozen state.

CRYPT (Gr. *krypto*, I hide), a vault under a church, either entirely or partly under ground. Crypts do not generally extend



Crypt of York Cathedral.

beyond the limits of the choir or chancel, and they are often of much smaller dimensions. Crypts were formerly used as chapels, and provided with altars and the other furniture requisite for the celebration of religious services; and they were also very frequently used as places of sepulture. It sometimes happens that a new church has been erected over the C. belonging to the old one. One of the largest crypts in England is that under Canterbury Cathedral; but there are few finer specimens of the C. any-

where than that under Glasgow Cathedral, which has been recently freed from rubbish and restored. Crypts seem to have originated in the customs of the early Christian ages. The tombs of the martyrs were first used as churches; and then churches were built above them.

CRYPTO'GAMOUS PLANTS (Gr. *kryptos*, concealed, and *game*, marriage) are those which have no true flowers, and no known male or female organs of fructification, and whose seeds, called *spores*, consist only of a single cell, and contain no embryo, but germinate indifferently from any point; and which Jussieu therefore designated *Acotyledonous Plants* (q. v.). The name C. P. was invented by Linnæus, and the *Cryptogamia* form a class of his sexual system, very distinct from all the rest. See BOTANY. Many C. P. have no leaves; some have not even a root, and those which are lowest in organization consist only of a single cell. Many are parasitic. Many look as if dead in dry atmosphere, and are revivified by rain. They are the lowest in organization of the vegetable kingdom, and are divided into *Filices* (Ferns), *Marsileaceæ*, *Lycopodiaceæ* (Club-mosses), *Equisetaceæ* (Horse-tails), *Musci* (Mosses), *Hepaticæ*, *Lichens*, *Fungi*, *Characeæ*, and *Algæ*.

CRYPTO'GRAPHY, the art of secret writing, more commonly called the art of writing in cipher (from Arabic *sifr*, void), has been in use from an early date in correspondence between diplomatists and others engaged in important affairs requiring secrecy. In modern times it has been the subject of learned care to Lord Bacon, the ingenious Marquis of Worcester, Dr. Wallis, Bishop Wilkins, Thicknesse, Falconer, Blair, &c. In our own history, it has at no time been in greater requisition than during the civil war, and among the politicians of the 17th century. And even now, when there is happily less need for mystery among our statesmen, the need for a perfectly undecipherable mode of secret communication has again had to be looked for, in order that information may pass by the electric telegraph without being understood by the officials in connection with the apparatus.

One of the most simple methods of C. is to use, instead of each letter of the alphabet, a certain other letter at a regular interval in advance of it in that series. Such was a mode of secret writing used by Julius Cæsar. As a variety upon this plan, the alphabet is used invertedly—*z* for *a*, *y* for *b*, *x* for *c*, and so on. Or, while the first seven letters are represented by the second seven, the next six may be represented by the last six. And many other variations may be adopted. But for all modes like these, there are modes of decipherment far from difficult. It is only necessary, in general, to bear in mind certain peculiarities of the language presumed to be used. Say it is the English. We readily remember that *e* is the most frequent letter; that *ea* and *ou* are the double vowels which most frequently occur; that the consonants most common at the ends of words are *r*, *s*, and *t*; &c. We also know how a single letter must be either the pronoun *I* or the article *a*; how *an*, *at*, and *on*, are the most common words in two letters; how *the* and *and* are the most frequent used words in three letters; &c. By taking advantage of these few obvious principles, a tolerably skilled decipherer will read almost any such piece of cryptographic writing in five minutes. The *Times* newspaper often gives, in its advertising columns, correspondence on delicate subjects, even assignations for elopements, written in this manner, the writers of which are of course little aware how open their secrets thus become to society.

Politicians and important personages conducting affairs of difficulty became long ago sensible of the necessity of using ciphers of greater abstruseness. The celebrated letter of Charles I. to the Earl of Glamorgan, in which he made some condemning concessions (elsewhere denied) to the Catholics of Ireland, was composed in an alphabet of 24 short strokes variously situated upon a line. Other letters by the same monarch are to appearance a mere series of numbers of two and three figures, divided by semicolons. In such cases, it was necessary that the two parties in the correspondence should have previously concerted what words each number was to represent. Bacon devised what he thought a not easily penetrable cipher, in which he employed only *a* and *b*, arranging each of these, in groups of five, in such collocations as to represent all the 24 letters.

Thus *aabab ababa babba* conveyed the word *Fly*. The great philosopher thought that preconcertment would here be necessary; but in reality any clever modern decipherer would have found no difficulty in reading any long letter composed in such a manner. The unfortunate Earl of Argyle, when preparing his expedition against the tyrannical government of James II., used a mode of secret writing which consisted in setting down the words at certain intervals, which he afterwards filled up with other words, making on the whole something intelligible, but indifferent. In our day, such a mode would not have been found proof against the ingenuity of those who have studied the means of decipherment. There are many other modes of secret writing, which it does not seem necessary to detail, as the art has become little more than a matter of curiosity. One of the ablest and amplest treatments of the subject is an article by Dr. William Blair in *Rees's Cyclopædia*. See also *Chambers's Journal*, No. 506 (Second Series), and Nos. 87 and 115.

CRY'STAL ISLANDS. See CORAL ISLANDS.

CRY'STAL PALACE. See SYDENHAM.

CRY'STALLINE ROCKS, a name given to all rocks having a crystalline structure. They are found belonging to every division of the crust of the earth, but are especially abundant in the most ancient azoic rocks; the greater proportion of intruded igneous rocks also possess this structure. When attempting in the laboratory to produce crystals, it is known that the building material must exist in a fluid condition, and this is obtained either by heating to fusion or by solution. It has been asserted that all C. R. have been produced under similar circumstances; and no one can doubt that lavas and more ancient rocks having a similar origin, have assumed this structure while solidifying from a condition of igneous fusion, while rock-salt is as certainly obtained from a saturated solution of salt. There are, however, many rocks, such as some fossiliferous limestones, in which this structure occurs, where it is not possible to conceive of their being in either condition. It is known that crystallization takes place in solid material, as in the axles of railway carriages, or in the crystals of pyrites in the chalk, where the iron has been gathered from the surrounding material while in a solid state. We know not what is the force that induces such a change in solid materials; it may be called metamorphic or molecular action, but these are names that mean nothing, and simply hide our ignorance. That such a force, inducing crystalline structure in amorphous masses, has been and is now at work on the solid strata of the earth, cannot be doubted.

CRYSTALLO'GRAPHY. A crystal is a piece of matter that, by the action of molecular forces, has assumed a definite geometrical form of some kind, with plane faces. There is a great variety of crystalline forms, each form being characteristic of one or more substances; and C. is the science which classifies the forms and shows the relations that subsist among them. The great majority of substances are capable of undergoing the process of crystallization, the exceptions being principally complex organic substances which tend to assume a globular or spherical form approaching that of organized structures. The most favorable condition for the crystallization of any substance is from its solution in water or other liquid. A liquid usually dissolves more of a salt when warm than when cold; and when a warm saturated solution is allowed to cool, a portion of the salt deposits itself in crystals. This process is that which is generally followed in the crystallization of saline substances. A second process resorted to in the case of the metals, such as bismuth, antimony, &c., and sulphur, is to fuse the material in a vessel, and when it is cooled down, so as partially to solidify the mass, the crust is broken through, and the liquid still remaining is poured off, when a net-work of crystals is obtained. A third method is to vaporize the substance, which on condensation resolves itself into crystals. Examples of this class are the formation of snow crystals from the water-vapor in the atmosphere, and the minute black crystals of iodine obtained by allowing its vapor to condense in a cold vessel or on a cold surface.

Many circumstances affect the crystallizing power of substances. Thus, water may be cooled down below its freezing or crystallizing point (32° F.), provided it be kept perfectly still, without becoming solid; but on subsequent agitation, it instantly crystallizes. Similarly, a hot saturated solution of sulphate of soda, or glauber salt, if cooled down in a still place, does not crystallize, but immediately does so when the liquid is agitated, or a fragment of any solid substance is introduced into it. The size of the crystals obtainable from any fluid depends much on the rate of cooling, and the state of commotion of the liquid. The more slowly the solution cools down, and the more quietly the process of crystallization is allowed to proceed, the larger are the crystals obtained; whilst when the liquid is rapidly cooled, and agitation is kept up, the crystals are comparatively small, and generally not completely formed. The reason of this will be at once apparent, for a large crystal is constructed of a multitude of smaller crystals, built up regularly so as to constitute a compound crystal of the same form as the more minute crystalline atoms; and when a liquid is cooled slowly in a state of rest, only a few minute crystals are produced at first, and these are gradually built round on all sides by successive layers, till large, well-defined crystals are the result; while, when the liquid is rapidly lowered in temperature, and especially when agitation is kept up, numerous minute crystals are formed at once, and do not adhere together. In either case, the liquid from which the crystals have separated is called the *mother-liquor*, and is a saturated solution of the salt.

The external forms of crystal amount to several thousands, but they may all be regarded as belonging to six different systems.

The *regular system* (otherwise called the *cubic*, *octohedral*, *tesseral*, *tessular*, *spheroidal*, or *equi-axed system*) is characterized by

having three axes or straight lines passing through the same point, of equal lengths, and placed at right angles to each other. The best illustration of this system is the cube or hexahedron (fig. 1), which has six square faces or planes, and the three equal axes (printed in bold lines) terminate in the center of each of the square faces. The planes or squares are symmetrically arranged, so that each is perpendicular to one axis, and parallel to the other two. The crystals have each six square faces, with twelve equal edges, and eight equal angles. Examples of substance which crystallize in the form of the cube or hexahedron, are—common iron pyrites (FeS_2), common salt, or the chloride of sodium (NaCl), fluor spar (CaF), galena, or the sulphuret of lead (PbS), and the

Fig. 10.

Fig. 11.

metals gold, silver, platinum, and copper. Another important crystalline form belonging to the regular system is the octohedron (fig. 2), where the terminations of the axes are in the angles of the crystals, as represented in the figure by the bold lines. It has eight faces, all of which are equilateral triangles, and twelve edges, with six angles, each of which has four faces. The diamond (C), alum, zinc-blende (ZnS), sal ammonia C. (NH_4Cl), magnetic iron ore (Fe_3O_4), fluor spar (CaF), and chrome iron ore, are examples. There are various secondary forms belonging to this system, derivable from the cube and octohedron, such as the rhombic dodecahedron (fig. 3), which has twelve faces, and is the form in which the garnet crystallizes.

The *square prismatic system* (known as the *pyramidal, tetragonal*, or *quadratic system*) has three axes placed at right angles to each other, of which two are of equal length, but the third may be longer or shorter. To this belong the *right square prism* (fig. 4), in which the lateral axes terminate in the center of each side face, and the perpendicular axis, is longer than the two lateral axes; and the *right square-based octohedron* (fig. 5), which resembles two pyramids placed base to base, and having eight faces, which form isosceles triangles. Examples of substances which crystallize in this system are—yellow prussiate of potash, native binoxide of tin, zircon, apophylite, calomel, &c.

The *right prismatic system* (otherwise known as the *right rhomboidal*, or *rectangular prismatic system*), is characterized by having three axes, all of unequal or different lengths, but placed at right angles to each other. The *right rhombic prism* (fig. 6), and the right *rhombic-based octohedron* (fig. 7), are forms included in this class, and examples of materials which crystallize in this form are —sulphur, arsenical iron pyrites, nitrate of potash, sulphate of potash, sulphate of baryta (heavy spar), topaz, arragonite, &c.

The *oblique prismatic system* (*oblique rhomboidal*, or *rectangular prismatic*) has three axes, which may be all of unequal lengths, two of which are placed at right angles to each other, whilst the third axis is so inclined as to be perpendicular to one of the two axes, and oblique to the other. To this belong the *oblique rhombic prism* (fig. 8), and the *oblique rhombic-based octohedron* (fig. 9). Many salts crystallize in this form, such as green vitriol (sulphate of iron), borax, sulphate of soda, carbonate of soda, phosphate of soda, realgar (native bisulphuret of arsenic), &c.

The *doubly oblique prismatic system* has three axes of unequal length, which intersect obliquely with each other. The forms are very irregular, which render them very puzzling to make out satisfactorily. Nitrate of bismuth, sulphate of copper, sulphate of manganese, quadroxalate of potash, and pyrotartaric acid, are examples.

The *rhombohedral*, or the regular *hexagonal system*, is known by the presence of four axes, three of which are in the same plane, and incline to each other at an angle of 60°, whilst the remaining fourth axis is perpendicular to the three. To this belong the *regular six-sided prism* (fig. 10), and the *rhombohedron* (fig. 11). Examples of this system are—calcareous spar, ice, quartz or rock crystal, nitrate of soda, beryl, arsenic, antimony, and apatite.

CRYSTALLO'MANCY, a mode of divination by means of transparent bodies, at one time very popular. A precious stone, crystal globe, or other transparent object, was employed, but a beryl was deemed most effective. In using it, the operator first muttered over it certain formulas of prayer, and then gave it into the hands of a youth or virgin—none others were pure enough to discern its revelations—who beheld in it the information required. Sometimes the desiderated facts were conveyed by means of written characters on the crystal; sometimes the spirits invoked appeared in the crystal to answer the questions asked.

CSA'BA, a town of Hungary, 7 miles south-south-west of Bekes. It is well built; some of the houses are even very elegant. It has a trade in grain, wine, and cattle. The women are also noted for their skill in making sacks and mattresses. Pop. of township (1880) 32,616.

CSANA'D, the name of two towns in Hungary, both situated on the Marõs, the one with a pop. of 4000, and the other with a pop. of 5500, who are engaged in agricultural pursuits.

CSAT, or CSATH (MEZO), a market-town of Hungary, near the Theiss, in the district Borsod, and about 15 miles S.E. of Miskolcz. Pop. 5000.

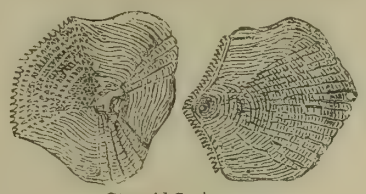
CSERVE'NKA, a town of Hungary, in the county of Upper Bacs, on the Franzens Canal, about 130 miles south of Pesth. Pop., which is German, 7000.

CSOMA DE KORÖS, ALEXANDER, a Hungarian scholar and traveler, whose name in his own language is written Köröse Csoma Sandor, was born about 1790 at Körös in Transylvania, and educated first at the college of Nagy-Enyed, and subsequently at Göttingen, where he devoted himself with great zeal to the study of the Oriental tongues. The dream and inspiration of his boyhood was the hope of one day discovering the original home of his Magyar ancestors, and as he grew up, it became the single thought and passion of his life. In 1820, he set out on his visionary pilgrimage. After a year's interval, his friends got a letter from him, dated Teheran, in which he expressed his conviction that the object of his search would speedily be obtained. Leaving Teheran, he wandered north-east through Little Bokhara, and at length reached Tibet, where he spent about four years (1827—1830) in the Buddhist monastery of Kanam, studying Tibetan. He soon discovered that there was little connection between that language and his native one, but still he hoped to make use of his researches, and set out for Calcutta. Here he learned, to his dismay, that the literature of Tibet was simply a translation from the Sanscrit—a language he might easily have acquired a knowledge of at home. His whole labor seemed to have been in vain. Fortunately for C., the library of the Asiatic Society of Bengal contained upwards of 1000 volumes in Tibetan which no one could catalogue. C. undertook and successfully executed the task. By the great Anglo-Indian scholars, Prinsep, Wilson, and others, he was very generously treated. He next prepared, at the expense of the government, a Tibetan grammar and dictionary (Calcutta, 1834), which was the first really accurate and valuable European work on the subject. It is still a standard treatise, and has been the guide of all good scholars since. C. wrote many articles on Tibetan literature in the *Asiatic Researches*. but still haunted, as of old, by the hope of discovering the early home of the Magyars, he once more set out on an expedition to the western confines of China, but died on the 11th April 1842, at Darjeeling in Sikkim.

CSONGRA'D, a town of Hungary, at the confluence of the Theiss and the Körös, 70 miles south-east of Pesth. The inhabi-

tants, (1880) 17,837 in number, are chiefly engaged in the rearing of cattle, and the cultivation of the vine.

CTE'NOID FISHES, an order of fishes, according to a classification proposed by Agassiz (see FISHES), characterized by *ctenoid* scales, i. e., imbricated scales, generally rounded or ovoid, with teeth or sharp projections on their hinder margin. The name is from the Greek *kteis* (gen. *ktenos*), a comb. The scales of



Ctenoid Scales.

C. F. are horny or bony and unenamelled. There are sometimes numerous rows of teeth or little spines, sometimes only one row, the rows successively wearing off as new ones are formed in the enlargement of the scale. Living C. F. are numerous, fossil ones comparatively few. Perches, flounders, and turbot may be mentioned as examples.

CTENOPHORA, an order of *Actionozoa*, of which the *Beroe* (q. v.) may be taken as the type. See also ACALEPHÆ; and the classification at ZOOLOGY.

CTESI'BIUS, a Greek who lived about 250 years B.C., was born at Alexandria, and was famous for his inventions in mechanics. We owe to him and his pupil Hero Alexandrinus, the pump, the bent siphon, and also the discovery of the elastic force of air, and its application as a motive power.

CTE'SIPHON, now Al-Madain, was a city of Assyria, on the eastern bank of the Tigris, the common winter residence of the Parthian kings, and finally the capital of the Parthian kingdom. Its ruins still attest its former magnificence.

CU'BA, the largest of the Antilles, and most important transmarine possession of Spain, stretches in N. lat. from 19° 50′ to 23° 9′, and in W. long. from 74° 8′ to 84° 58′. It has a length of rather more than 750 miles, and an average width of 50 miles, its area being about 45,700 square miles. It is larger than Ireland, and less than England. The surface is mountainous at the south-east coast, where the Sierra Maestra, rising in some places to an elevation of 8000 feet, runs from Cape de Cruez to Cape de Mayzi. In the central part of the islands there are rugged hilly districts between Santa Clara and Puerto Principe, and also north-west of Trinidad. What remains of the country, although undulating, consists chiefly of well-watered plains, which everywhere support a luxuriant vegetation.

Rocky reefs and muddy shallows beset about two-thirds of the coast. In some localities, however, the sea is deep to the very shore, offering many excellent havens, and those, too, situated on the busiest thoroughfares of the western hemisphere; the chief of these being Havana, the admirable situation of which makes it the emporium of Central America. A somewhat elevated watershed crosses the island in the direction of its length, and as the streams run at right angles to it, they are necessarily short. There is in C. no distinction of dry and rainy seasons, and there are showers every month. Hurricanes are less frequent than in the other West India Islands, but they sometimes do occur, and cause widespread desolation. One which swept over C. in the middle of October 1870, caused the loss of 2000 lives. Another occurred in the end of September 1873. Earthquakes are frequent. The cultivated portions of C. produce in abundance sugar, tobacco, maize, rice, yams, bananas, coffee, and all the products of the tropics; while in the districts left in a state of nature are reared countless herds of cattle. Sugar is, however, the chief product of the island; and all over the western districts the traveler sees vast level or undulating tracts covered with cane fields, and factories employed in crushing, boiling, and refining the sugar.

Since the close of the late American war, the Cuban sugar-trade has been immensely increased, and the quantity exported in good years has recently been valued at the prodigious sum of 15, or even 20 millions sterling. Fifteen per cent. of this sugar goes to England, and seventy-five per cent. to the United States. The exportation of tobacco forms still a large item of the exports from Cuba. The chief imports consist of flour, salted fish, manufactured goods, hardware, machinery.

The enormous development of Cuban commerce cannot be accounted for either by the enterprise of the inhabitants or to good government—and least of all to the latter, for the Spaniards have done nothing for C. but to make it supply Madrid with the largest possible revenue. It is due to the great demand for sugar in America, and the monopoly C. now enjoys of slave-labor.

The population of C. in 1877 was 1,394,516; in 1872 it was 1,370,211, of whom 730,750 were whites, about 34,000 Chinese and Hindu coolies, and 605,461 blacks. Of the blacks, 225,938 were free, and 379,523 were slaves. Of the whites, about 600,000 were creoles, or natives of the island; while 120,000 were 'peninsulares,' or natives of Spain. The slaves of pure blood alone have the strength necessary to do the hard work of the sugar estates, and the prosperity of the island is dependent on them. Although the creoles and the 'peninsulares' are of the same origin, the difference between them is most striking. They can be distinguished at a glance in the streets of Havana.

The creoles are feeble and indolent, even when they are children of parents born in Spain. The Cuban Spaniards, on the other hand, are a sturdy and energetic body of men. Recruited from the north-eastern parts of Spain, they go to C. as adventurers, chiefly to find employmennt as traders and mechanics, but obtain the greater share of the wealth of the island. There are upwards of 200,000 adult male creoles, and half that number of Spanish Cubans; but the latter—all men—through the large volunteer force, which they almost exclusively recruit, and the favor of the Spanish government, which distrusts the creoles, have absolute control over the government of the island, which is administered in a manner scandalously unjust. They treat the creoles with a scorn and contempt only exceeded by the hatred, mixed with fear, with which the latter regard the dominant population 'Cuba for the Cubans,' is the watchword of the creoles, whose most anxious desire it is to be rid of the adventurers, who have secured for themselves the best share of the wealth of the island. If they could secure this object, they believe that even with emancipation they would be in a better position than now, and accordingly they manifest sympathy for the negroes, and join with them in opposition to the 'peninsulares.'

C. is divided into three intendencias—the western, middle, and eastern. In the first, there were (1872) upwards of a million of inhabitants. It includes Havana with 200,000 inhabitants, Matanzas with 36,000, Cardenas with 13,000, and several other towns connected by railways. The middle division, which extends eastward to the north-east corner of the Great Bay and the Boca de Nuevitas, has only a population 75,000, 30,000 of whom live in the capital, Puerto Principe. The eastern division has 249,000 inhabitants; the capital is Santiago, with a population of 37,000. The chief towns of the western division are connected by railways, and it is well settled and prosperous, the great sugar factories and tobacco plantations, which constitute the wealth of the island lying there. The middle and eastern divisions are very partially cultivated, and, owing to civil war, are becoming much less productive than they were. Many of the landowners of the eastern part of the island have sold their slaves to those of the Havana district, and have migrated to Jamaica and the United States.

In 1492, C., which is often spoken of as the 'Pearl' or 'Queen of the Antilles,' was discovered by Columbus during his first voyage. In 1511, the island began to be permanently colonized, becoming, within ten years, the base of all the various operations against Mexico.

While, in the first quarter of the present century, every continental portion of Spanish America established its independence, C. remaining, like Puerto Rico, faithful to the mother-country, largely profited by the intestine broils of the revolted provinces, for, when the old Spaniards were expelled in mass from the mainland, many of them naturally took refuge in the still loyal islands, enriching them with their capital, and energy, and skill. C. has long been coveted by other nations. In 1762, Havana was captured by a British armament, but was restored in the following year. During the present age, the island has been an object of cupidity to the United States—a cupidity checked more powerfully by jealousy on the part of France and England than by Spain's own resources; and, in fact, it has been twice attacked—in 1850 and 1851—by individual Americans without success. They were commanded by a Spaniard of the name of Lopez, who, being taken prisoner, was executed as a traitor. The termination of the American war had an unexpected effect on the position of C. The island has been coveted because it was the only market from which slaves could be imported into the southern states, and this trade was at an end. This was not, however, the only effect of the war. It destroyed the production of sugar in the southern states, and C. supplied the want. Great interests were created in New York, which favored the perpetuation of slavery in C., and its existence as an independent state, or a dependency of a foreign power, became more desirable for the Americans than its annexation. The Spanish revolution of 1868, when Queen Isabella was driven from the throne, effected another change in Cuban politics. The Madrid ministry, in 1870, passed a measure known as the Moret law, from Senor Moret y Prendergast, the colonial minister at the time, which declared that every slave at the age of 60 should become free—and emancipated all the unborn offspring of slaves. This law never was enforced, its publication even having been prohibited by the 'peninsulares;' and the Madrid government have never been in a position to enforce it or any other measure which meets the disapproval of the 'loyal party' in Cuba. Instead of

doing so, it has accepted their alliance, and aided them by sending troops to crush the creole and negro insurrection, which broke out in 1868. The struggle was carried on with varying success, and often with unexampled ferocity, for eleven long years. It was not till the end of 1879 that the authorities, partly by military energy, partly by terms of compromise, succeeded in quelling the rebellion. Pardon was offered to rebels laying down their arms, and restoration of confiscated property. See *The Pearl of the Antilles*, by A. Gallenga (Lond. 1873). For a picturesque description of Cuban life and manners, see another work also called *The Pearl of the Antilles*, by W. Goodman (1873). See also *The Mambiland*, by James J. O'Kelly (1874).

CUBA'GUA, an island in the Caribbean Sea, off the north-east coast of Venezuela in South America, is situated in the department of Maturin, between Margarita and the mainland, about 30 miles north of the town of Cumana.

CUBE, a solid with six square faces, each of which is parallel to the one opposite to it. It is a form of frequent occurrence in nature, especially among crystals. See CRYSTALLOGRAPHY. In arithmetic, the C. of a number is the product of its multiplication three times by itself. This use of the term arises from the circumstance that the solid contents of a C. may be expressed by the third power of the number which expresses the length of one of its edges. Thus, if the edge of a C. be a line of 4 inches, its solid contents are equal to 64 cubic inches. Conversely, the C. root of a number is that number, which, multiplied three times by itself, produces the first number. See DOUBLING THE CUBE.

CU'BEBS, or CUBEB PEPPER, the dried berries of *Cubeba officinalis* and other species of *Cubeba*, a genus of climbing shrubs of the natural order *Piperaceæ*, very closely allied to the true peppers, but distinguished at once by the contraction and elongation of the berries at the base, so that they appear to be stalked, upon which account C. are sometimes called *Piper caudatum*, or tailed pepper. *Cubeba officinalis* is a native of Penang, Java, New Guinea, &c., and is said to be extensively cultivated in some parts of Java. Its spikes are solitary, opposite to the leaves, and usually produce about fifty berries, which are globular, and when dried, have much resemblance to black pepper, except in their lighter color, and the stalk with which they are furnished. *Cubeba canina*, a native of the Sunda and Molucca Islands, is supposed also to yield part of the C. of commerce, and the berries of *C. Wallichii* possess similar properties. C. are less pungent, and more pleasantly aromatic than black pepper; they are used in the East as a condiment, but in Europe chiefly for medicinal purposes; they act as a stimulant, and are sometimes found useful in cases of indigestion, also in chronic catarrhs, and in many affections of the mucous membrane, particularly those of the urino-genital system. C. contain a principle called *Cubebine*, analogous to that contained in pepper (*piperine*). C. appear to have been known in Europe from ancient times. In 1305, Edward I. granted to the corporation of London the power of levying a toll of one farthing on every pound of C. passing over London Bridge.

CUBIC EQUATIONS. A cubic equation containing but one unknown quantity, is one in which the highest exponent of the quantity in any term is 3. Every such equation can be reduced to the general form $x^3 + px + q = o$, in which the coefficient of x^3 is 1, and that of x^2 is zero. Every cubic equation of this form has three roots, all of which may be real, or one only may be real, and the other two imaginary. The roots will all be real, when p is essentially negative, and $\frac{p^3}{27} > \frac{q^2}{4}$ numerically. One root only will be real when p is essentially positive, or when it is negative, and $\frac{p^3}{27} < \frac{q^2}{4}$ numerically. If p is essentially negative, and $\frac{p^3}{27} = \frac{q^2}{4}$, two of the roots are equal. When one of the roots only is real, the equation may be solved by the following formula, known as Cardan's formula:

$$x = \sqrt{-\frac{q}{2} + \sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}} + \sqrt{-\frac{q}{2} - \sqrt{\left(\frac{q^2}{4} + \frac{p^3}{27}\right)}}.$$

When the roots are all real, this formula fails to give their values. Methods of solving C. E. are to be found in most books on trigonometry and algebra. They are all troublesome. The reader will find the theory of their solution admirably discussed in Young's *Theory of Equations*. See also EQUATIONS.

CU'BICAL NI'TRE is a commercial name applied to the nitrate of soda ($NaNO_6$). See SODA.

CU'BIT (Lat. *cubitus*), a measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the middle-finger. The C. of the Romans was about 17⅝ inches, and that of the Hebrews 22 inches, but its length is now generally stated at 18 English inches.

CUCKING-STOOL. See DUCKING-STOOL.

CU'CKOO (*Cuculus*), a genus of birds of the order of Climbers (q.v.); the type of a family, *Cuculidæ*, which contains a large number of species, mostly confined to the warmer regions of the globe, although some of them are summer visitants of cold climates. The beak is compressed and slightly arched, and the tail long and rounded, the wings rather long, the tarsi short, two toes directed forwards, and two backwards, the outer hind-toe capable of being brought half round to the front. The feet are thus adapted for grasping and moving about upon branches, rather than for climbing, and the long tail is much used by many of the species for balancing the body, as they hop from branch to branch in the thick tropical woods which they frequent. The name C. is derived from the note of the male of the Common C. (*Cuculus canorus*), which, although monotonous, is always heard with pleasure, being associated with all that is delightful in returning spring.

A similar name is given to the bird in many languages. The C. is a very widely diffused bird; it is found in India and in Africa, and migrates northwards in summer, even to Lapland and Kamtchatka. It appears in Britain in April, and all except the young birds are believed to migrate southwards again before the middle

Common Cuckoo (*Cuculus canorus*).

of August. It frequents both cultivated districts and moors. There is no pairing or continued attachment of the male and female, and the female, after having laid an egg on the ground, deposits it, *with her beak*, in the nest of some other smaller bird, leaving the egg to be hatched and the young one to be fed by the proper owners of the nest.—The egg of the C. is very small for so large a bird, being not larger than the skylark's, and the number she will lay is uncertain; but the young one soon acquires size and strength enough to eject from the nest any eggs which may remain in it, or unfortunate young birds, the true offspring of its foster-parents, and it seems restless and uneasy till this is accomplished. It works itself under them, and then jerks them out by a motion of its rump. Its back at this early age exhibits a peculiar depression between the shoulders, so that an egg or a young bird can easily be got to lie upon it; but this depression soon disappears, and along with it the singular instinct with which it is supposed to be connected. The hedge-sparrow, the yellow-hammer, the pied wagtail, and the meadow pipit, are among the birds most frequently selected by the C. as its substitutes in incubation and the care of its young. A pair of meadow pipits usually accompany the cuckoo wherever it goes. The reason of this curious fellowship has not been ascertained.—Among the *Cuculidæ* of North America, one of the most interesting is the Yellow-billed American C., sometimes called from its note the *Cow-cow* or *Cow-bird* (*Coccyzus Americanus*). It is among the rarest of British birds. It does not lay its eggs in the nests of other birds, but builds and hatches for itself—exhibiting, however, a remarkable peculiarity in laying its eggs at such long intervals, that a very evident difference of age appears among the young in the same nest.

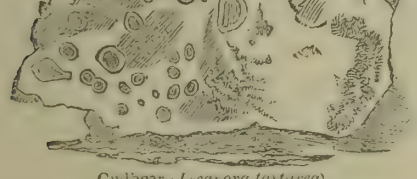
CU'CUMBER (*Cucumis*) a genus of plants of the natural order *Cucurbitaceæ*. The COMMON C. (*C. sativus*), distinguished by heart-shaped, acuminately pentangular leaves, which are rough with hairs approaching to bristles, and oblong fruit is a native of the middle and south of Asia, and has been cultivated from the earliest times. Its fruit forms an important article of food in its native regions, south of Europe, &c., and an esteemed delicacy in colder countries, where it is produced by the aid of artificial heat. Many varieties are in cultivation, with fruit from four inches to two feet long, rough, smooth, &c. Young cucumbers are much used for pickling, and are called *gherkins*. The C. is cultivated in fields even in the south of England, for the supply of the London market; but in the northern parts of Britain, the aid of a hot-bed is required even to produce fruit fit for pickling. The C. requires a sunny situation, and a free, rich soil.—To this genus belong other species valued for their edible fruit. *C. Anguria* is a West Indian species, with fruit about as large as a pullet's egg, much esteemed as an ingredient in soups. The SNAKE C. (*C. flexuosus*) grows to a great length, and is similar in quality to the common cucumber. *C. serotinus* is cultivated in Turkey, *C. macrocarpus* in

Brazil; the CONOMON (*C. conomon*) is much cultivated in Japan. The Melon (*C. melo*), Water Melon (*C. citrullus*), Chate (*C. chate*), and Kaukoor (*C. utilissimus*), are noticed in the article MELON; the species yielding colocynth, in the article COLOCYNTH.—The DUDAIM (*C. dudaim*) is very generally cultivated in Gardens in the East for the fragrance of its fruit, which, however, is almost tasteless. It is supposed that this plant is sometimes meant in the Old Testament, where the English version has *mandrake*.—The SPIRTING C., SQUIRTING C., or WILD C., which yields the drug called Elaterium (q. v.) belongs to an allied genus.

CUCURBITA'CEÆ, a natural order of exogenous plants, consisting chiefly of herbacecous plants, natives of the warmer regions of the globe, having succulent stems which climb by means of lateral tendrils. There are some shrubby species. The fruit (*pepo*) is peculiar; it is more or less succulent, has a thick fleshy rind, and the seed bearing parietal placentæ either surrounding a central cavity, or sending prolongations inwards. The seeds are flat and ovate, embedded in a sort of pulp, which is either dry or juicy.—This order contains about 300 species, very many of which yield fruits much used for food in warm climates, and some of them are cultivated in colder regions as articles of luxury. The fruit of some attains a very large size. To this order belong the Cucumber, Melon, Gourd (of many kinds), Pumpkin, Squash, Vegetable Marrow, Gourd, &c. The young shoots and leaves of many species are also used as potherbs; and the roots of some abound in a bland fecula, and are edible, as those of *Momordica dioica* and *Bryonia umbellata*, East Indian plants.

Yet acridity is a prevailing characteristic, of which the Spirting Cucumber (see ELATERIUM) of the south of Europe, and the Common BRYONY (q. v.) are examples. These are not without their use in medicine, but still more important is the COLOCYNTH (q. v.).—Among the more interesting species of this order is *Hodgsonia heteroclita*, a gigantic species, which is found in the Himalaya Mountains, ascending to an elevation of 5000 feet. The seeds of some C. are used as almonds, and yield oil by expression, as those of *Telfairia pedata*, an African plant. *Bryonia dioica* is the only British species, and does not extend to Scotland or Ireland.

CU'DBEAR, a dyestuff similar to Archil (q. v.) and Litmus (q. v.), and obtained in the same manner from lichens by the action of ammoniacal liquids. It is chiefly employed as a purple-dye for woollen yarn, but the color is rather fugitive. The name C., or C. LICHEN, is often appropriated to one particular species of lichen, *Lecanora tartarea*, which is abundant on rocks in the Highlands of Scotland and in the Alpine and northern districts of



Cudbear (*Lecanora tartarea*).

Europe, and from which the dyestuff C. is usually obtained by maceration for ten or twelve days in urine with water and chalk. The name is a corruption of *Cuthbert*, and is derived from that of Dr. Cuthbert Gordon, under whose management the manufacture of this dyestuff was begun in Leith about the year 1777, by Mr. Macintosh of Glasgow. The species of the genus *Lecanora* are crustaceous lichens, with a flat uniform *thallus*, and unstalked *shields*. *L. tartarea* forms a thick, granulated, and tartareous grayish-white crust, with scattered yellowish-brown shields. It is sometimes called *White Swedish Moss*, being largely imported from Sweden.

CUDDALO'RE, the chief town in the southern division of Arcot (q. v.), is one of the few seaports on the Coromandel, or east coast of Hindustan. It is situated on the estuary of the Southern Pennaur, a considerable tributary of the Bay of Bengal, being in lat. 11° 43′ N., and long. 79° 50′ E. It is 15 miles to the south of Pondicherry, and 100 to the south of Madras. Though the river itself is beset by a bar, which admits only vessels of moderate size, yet there is good anchorage off-shore at the distance of a mile and a half. The site is not more than 5 feet above high-water mark; but notwithstanding this apparently insalubrious position, the climate is said to be peculiarly healthy. C. was at one time a place of great strength; and in that respect it was frequently an object of contention in the wars which, during the latter half of the 18th c., so long desolated this neighborhood. In 1758, it was taken by the French from the English, who had held it for 77 years; and, after various intermediate vicissitudes, it was finally ceded to its original possessors in 1783. Pop. (1871) 40,290.

CU'DDAPAH, a native town with a military cantonment in the presidency of Madras, from which it lies about 140 miles to the north-west. It stands, at the height of 507 feet above the sea, near the right or south bank of the Northern Pennaur, which flows into the Bay of Bengal. Lat. 14° 32′ N., and long. 78° 52′ E. The native town itself claims notice merely as the capital of the district of its own name; and the military cantonment, pleasantly overhanging the Bogawanka, an auxiliary of the Pennaur, contains barracks for Europeans, and spacious lines for sepoys. Pop. (1871) 16,275.

CUDDAPAH, the district mentioned in the preceding article, extends in lat. from 13° 12′ to 16° 19′ N., and in long. from 77° 52′ to 79° 48′ E., containing 8367 sq. m., and (1871) 1,351,194 inhabitants. Sloping towards the Bay of Bengal, the country ranges in its general elevation above the sea, between 1182 and 450 feet. C. is traversed in its length from north to south by numerous parallel ridges, which constitute a part of the Eastern Ghauts—some of the peaks rising 3500 feet above the sea level. The maximum, mean, and minimum temperatures are said to be respectively 98°, 81°, and 65° F. In the hot season, the climate is understood to be peculiarly prejudicial to European constitutions. The most striking feature in the physical character of the district is the remains of diamond mines, now abandoned, and probably exhausted, situated about seven miles from the capital. C. was ceded to Britain in 1800; and in 1846 it was the scene of serious disturbances, occasioned by an unwise interference on the part of government with the prescriptive titles to landed property.

CU'DDY was a name first applied in East India trading ships to a cabin under the poop, where the men messed and slept. The same name was afterwards given to the only cabin in very small vessels, and sometimes to the cooking-room.

CU'DWEED, the popular name of many species of plants of the genera *Gnaphalium*, *Filago*, and *Antennaria*, belonging to the natural order *Compositæ*, sub-order *Corymbiferæ*, the stems and leaves of which are more or less covered with a whitish cottony down; and the heads of flowers consist, in great part, of dry involucral scales, and may be kept for a long time without undergoing much apparent change, so that they may be reckoned among *Everlasting Flowers* (q. v.). The cudweeds are small plants of very unpretending appearance, some of them common in Britain. *Antennaria dioica* is very frequent in dry mountain pastures. It is sometimes called Cat's-foot. Its heads of flowers, from the appearance of which it derives this name, were formerly officinal, and were employed as an astringent in pectoral diseases.

CU'DWORTH, RALPH, D.D., an illustrious English divine, was born in 1617 at Aller, in Somersetshire, and admitted pensioner of Emmanuel College, Cambridge, in 1630, where he took his degree of M.A., and became an eminent tutor. About 1641 he was presented to the rectory of North Cadbury, in Somersetshire; and in 1644, upon taking his degree of B.D., maintained two theses, in which can be discerned the germs of his *Intellectual System*. In the same year he was appointed master of Clare Hall, Cambridge, and in 1645, regius professor of Hebrew; after which he began to apply himself assiduously to the study of Jewish antiquities. In 1651, he took his degree of D.D.; in 1654, he was chosen master of Christ's College; in 1662, appointed to the vicarage of Ashwell; and in 1678, installed prebendary of Gloucester. He died at Christ's College, July 26, 1688.

C.'s *magnum opus*, entitled *The True Intellectual System of the Universe*, was published in 1678. It is a work of great learning, acuteness, and loftiness of thought; but some, at the time, fancied that C. exhibited too much impartiality in stating the atheistic arguments. Dryden said 'that he raised such strong objections against the being of a God and Providence, that many thought he had not answered them.' Lord Shaftesbury and Bayle were of this opinion also. The accusation of impartiality—a rare offence in those contentious days—is not likely to lessen our admiration of Cudworth. The philosophy to which he was attached was that of Plato, and, in consequence, he estimated highly the writings of the Alexandrian school, to which his own bear some resemblance. The obloquy to which his adventurous studies exposed him, does not seem to have greatly affected him. Besides *The Intellectual System*, C. left in MS. *A Treatise concerning Eternal and Immutable Morality*, which was published by Dr. Chandler, Bishop of Durham, in 1731; and forms, or was intended to form, the second part of *The Intellectual System;* also a discourse *On Liberty and Necessity*, *On Moral Good and Evil*, a discourse *On the Creation of the World and the Immortality of the Soul*, &c. These MSS. are now in the British Museum.

CUE'NCA, a city of Spain, at the confluence of the Jucar and Huecar, about Midway between Valencia and Madrid. It is romantically situated on a rocky eminence, 3400 feet above the level of the sea, and is surrounded by hills. It appears to have derived its name (Lat. *concha*, a shell) from its position and appearance. Ford says it is 'indeed a hill-girt *shell*.' The town is of Moorish origin. The streets are narrow and crooked. The chief buildings are the cathedral, the bishop's palace, and a fine bridge over the Jucar (erected in 1523), connecting the city with the convent of San Pablo. C. was once celebrated for arts, literature, and industry, but its glory has now quite departed. It suffered much during the Peninsular campaign. Pop. 8200.—C. gives name to a mountainous, well-watered province, yielding excellent timber, honey, wine, and grain, with good pasture, and various minerals, including iron, coal, copper, and silver. Area about 12,000 miles. Pop. (1877) 237,497.

CUENCA, a city of Ecuador, in South America, stands on a wide plain or table-land, 8640 feet above the level of the sea. It is 85 miles south-south-west of Quito, the capital of the republic; in lat. 1½° S., its proximity to the equator, however, being largely neutralized, with regard to climate, by its altitude. Pop. estimated at 30,000. It possesses a cathedral and a university.

CUE'VA DE VE'RA, a town of Spain, in the province of Granada, 42 miles north-east of Almeria. It is situated on a plain on the right bank of the Almanzor, near its entrance into the Mediterranean. It is generally well built and its streets regular. The principal edifices are an old Moorish castle, and the parish church in the Doric style. C. has manufactures of hardware, earthenware, and of wine and oil; and a large number of persons are employed in mines in the vicinity. Pop. 20,644.

CUICHUNCHU'LLI (*Ionidium parviflorum*), a Peruvian plant of the natural order *Violaceæ*, half shrubby, with minute leaves, possessing very active emetic and purgative properties, and said to be a certain remedy for *Elephantiasis tuberculata*, a reputation which, if even partially well founded, ought to recommend it to the particular attention of the benevolent and humane. Other species of *Ionidium* share the same name, properties and reputation. One of them was formerly supposed to yield ipecacuanha, and its root is still known as White Ipecacuanha. See IPECACUANHA.

CUIRA'SS, as its name (Fr. *cuir*, leather) implies, was originally a jerkin, or garment of leather for soldiers, so thick and strong as to be pistol-proof, and even musket-proof. The name was afterwards applied to a portion of armor made of metal, consisting of a back-plate and breast-plate hooked or buckled together; with a piece jointed to the back called a *culet* or *garde de reines*.

CUIRASSIE'RS, in the time of Queen Mary, were heavy horsemen wearing body-armor over buff-coats. They carried swords and pistols, and the reins were strengthened with iron chains. In modern armies, the name is often given to the heaviest cavalry. Napoleon's twelve regiments of C. attracted much attention during his wars. The first rank of Russian C. are armed with lances. The only C. in the British army (wearing the cuirass) are the Life Guards (red) and Horse Guards (blue); and in these the cuirass is now regarded rather as a matter of show than of use.

CUISSARTS, among ancient armor, were worn by troopers. They consisted of small strips of iron-plate laid horizontally over each other round the thigh (Fr. *cuisse*), and riveted together.

CUJA'CIUS, properly, JAQUES DE CUJAS, or CUJEUS, one of the most distinguished jurists of the 16th c., born in 1522, was the son of a tanner of Toulouse. After studying law, he was appointed teacher of the same at Cahors (1554), and in the following year, by the recommendation of the Chancellor L'Hopital, gained the chair of law in the university of Bourges. In 1557, he became a professor at Valence. After several changes, he returned to Bourges in 1577, where he resided till his death, October 4, 1590.

His great reputation as a jurist was founded on his study of original MSS. of the Roman laws, and on his classical treatment of these authorities. He had in his library 500 MSS. on Roman law, and by his emendations contributed greatly to remove the obscurities of jurisprudence. A complete collection of his works was edited by Fabrot (10 vols., Par. 1658), and has since been republished frequently. Uhl has edited separately C.'s *Animadversiones et Observationes*. C.'s daughter made herself notorious by her immoralities. See Spangenberg's *C. und seine Zeitgenossen* (Leip. 1822).

CU'LDEES, or KELDEES (Celt, *Ceile De;* Lat. *Colidei, Culdei, Calledei, Keldei, Keledei*), the name given in the British islands to an ancient order of ecclesiastics. The word seems to be of Celtic origin, and in the Irish language signifies an 'attendant of God.' Giraldus Cambrensis, writing towards the end of the 12th c., when the order still flourished, interprets the name in one place by the Latin word *cælicola*, i. e., 'worshiper of heaven;' and in another by *cælebs*, i. e., 'single,' or 'unmarried.' Boece and Buchanan, in the 16th c., translate it *cultores Dei*, i. e., 'worshipers of God.'

There is some uncertainty as to the first appearance of the order. There is no trace of it in the works of Adamnan, of Bede, of Alcuin, or of any other ecclesiastical historian of the 8th or 9th century. An abbot and bishop of the north of Ireland, who compiled a metrical calendar of Irish saints about the year 800, was known in his own time as 'Ængus the Ceile-De.' But it has been questioned whether the title was not used rather to denote his great personal piety, than to describe his ecclesiastical character. The Four Masters, again, in their *Annals of Ireland*, compiled about the year 1636, record certain great wonders wrought by a Ceile-De in the year 806. But no such event is recorded in the ancient chronicles from which the Four Masters compiled their work, and Irish antiquaries think that the passage must therefore be rejected as apocryphal. But in Irish annals of undoubted authority, it is chronicled that, in the year 919, 'a Ceile-De came across the sea westward to establish laws in Ireland;' in other words, as Irish archæologists conjecture, to bring the Irish into conformity with the rule for canons which had been enacted in 816, at the council of Aix-la-Chapelle. The Annals of Ulster record that, in 920, Armagh was plundered by Godfrey, son of Ivor, the Dane, but that he spared the oratories with the C. and the sick. The C. of Armagh, who thus appear in the beginning of the 10th c., survived till the beginning of the 17th century. Archbishop Usher, who died in 1655, writes that they continued until within his own memory. They were secular priests or canons, about twelve in number, living in community, under the rule of a prior, who—after the beginning of the 13th c., when the metropolitan cathedral of St. Patrick was remodelled after the English fashion—officiated as precentor, his C. being the clerks or choir. The antiphonary or service-book, with the musical notation, from which they sang, is still preserved in the library of Trinity College, Dublin; and its calendar records the deaths of several of their number, one of them so lately as the year 1574.

The prior seems generally to have been a pluralist, its having been formally ruled in 1448, after an appeal to Rome, 'that the priory of the college of secular priests, commonly called Culdees, being a simple office, and without cure of souls, is not incompatible with a benefice.' The C. of Armagh, dissolved at the Reformation in 1541, were resuscitated for a brief space in 1627. Their old possessions—among which were seven town-lands containing 1423 acres, seven rectories, and four vicarages—were in 1634 bestowed upon the vicars choral of the cathedral, who still enjoy them.

There were at least seven other houses of C. in Ireland, viz., at Clonmacnois, Clondalkin, Devenish, Clones, Popull, Monaincha, and Sligo.

If tradition could be trusted, the first appearance of C. in Scotland should be placed about the middle of the 9th century. A leaf of the Register of St. Andrews, written about 1130, relates that Brude, the son of Dergard, the last king of the Picts (who ceased to reign about 843), gave the island, since called St. Serf's Inch, in Lochleven, to God, St. Servan, and the Culdee hermits serving God there. They were governed by an abbot; and about the year 1093, during the rule of Abbot Ronan, they gave up their island to the Bishop of St. Andrews, on condition that he should find them in food and raiment. They had grants of lands or immunities from all the kings of the Scots who reigned between 1039 and 1153, the roll of these royal benefactors being headed by the renowned Macbeth (1039—1056) and his wife Gruoch, the daughter of Bodhe. They had a grant of a church from each of the three bishops who ruled the see of St. Andrews between 1040 and 1093; and about 1120, they had a grant of lands from one of the sons of King Malcolm Canmore and St. Margaret—Ethelred, Earl of Fife, and hereditary lay abbot of the Culdee monastery of Dunkeld. A few years afterwards, the Bishop of St. Andrews gives their island, and all their possessions, including their church vestments and their books, to the newly founded Canons Regular of St. Andrews, in order that a priory of that rule might supplant the old abbey of C. in the St. Serf's Inch. About 1140, the bishop's grant was enforced by a charter from King David, in which it was ordered that such of the C. as chose to live canonically and peacefully under the new canons should remain in the island. 'If any one of them refuse so to do,' says the king, 'my will is, and I command, that he be expelled from the island.' We hear no more of the Culdee hermits of Lochleven. The Canons Regular who came in their place continued till the Reformation, and we are indebted to one of their priors, Andrew Wintoun, who died about 1429, for a valuable metrical Chronicle of Scotland.

A catalogue of the books of the Culdee abbey, when it was bestowed upon the Canons Regular of St. Andrews, about 1140, has been preserved. The number of volumes was not quite twenty. They were—a Pastoral, a Gradual, a Missal, some of the works of Origen, the Sentences of St. Bernard (who was still living), a Treatise on the Sacraments, in three parts, a part of the Bible, a

Lectionary, the Acts of the Apostles, the Gospels, the works of Prosper, the books of Proverbs, Ecclesiastes, and Canticles, a Gloss on the Canticles, a work called *Interpretationes Dictionum*, a Collection of Sentences, a Commentary on Genesis, and a Treatise on the Exceptions from Ecclesiastical Rules.

The C. of St. Andrews were of more importance, and not perhaps of less antiquity, than those of Lochleven. The death of an abbot of St. Andrews is chronicled by the Irish annals in 747. It is not said that he was a Culdee; but in 944, when Constantine, the king of Scots, exchanged his crown for a monk's cowl, it is recorded that he became 'abbot of the Culdees of St. Andrews.' No more is heard of them till about the middle of the 12th century. A priory of Canons Regular had now been planted beside them, and from its records we learn that in the church of St. Andrew, such as it then was, there were thirteen C., holding their office by hereditary tenure, and 'living rather according to their own pleasure and the traditions of men, than after the rules of the holy fathers;' that some few things of little importance they possessed in common; that the rest, including what was of most value, they held as their private property, each enjoying what he got from relatives and kinsmen, or from the benevolence granted on the tenure of pure friendship, or otherwise; that after they became C., they were forbidden to have their wives in their houses, or any other women of whom evil suspicion could arise; that the altar of St. Andrew was left without a minister, nor was mass celebrated there except on the rare occasion of a visit from the king or the bishop, for the C. said their own office after their own way in a corner of the church. The attempt to supplant the C. by Canons Regular, which had succeeded at Lochleven, was repeated at St. Andrews, but failed. The C. kept their own church—St. Mary's, or the Kirk of the Heugh—and had a voice along with the Canons Regular in the election of the bishop. Their abbot disappears about the middle of the 11th c.; and soon afterwards their 'prior' exchanges that title for the name of 'provost.' Their distinctive character was gradually passing away; before the end of the 14th c. they lose their share in the election of the bishop; their name of Culdee is heard no more; their church, about the same time, takes the name of the King's Chapel-royal; and henceforth there remains nothing to distinguish them from the secular priests of other collegiate churches.

The C. of the church of St. Mary at Monymusk, in Aberdeenshire, appear to have been founded by the Bishop of St. Andrews towards the end of the 11th century. In the beginning of the 13th c. they are found making claim to be regarded as Canons Regular. The claim was resisted by the Bishop of St. Andrews, and in 1211, after an appeal to Rome, the dispute was settled by a compromise, which provided that there should be thirteen C. at Monymusk, of whom one—to be chosen by the bishop from a list of three presented by the other C.—should be the master or prior; that they should have a refectory, a common dormitory, and an oratory, but no cemetery; that they should not adopt the monastic or canonical life or rule without leave of the bishop; and that when he came to Monymusk, he should be received by the C. in solemn procession. Before this agreement is 50 years old, the name of C. disappears from Monymusk, and their house is recognized as a priory of Canons Regular.

C. are found at Abernethy, in Strathearn, about 1120. In the end of that century, their possessions appear to have been divided between their hereditary lay-abbot (the founder of the noble family of Abernethy) and the prior and C. by whom the burdens of the ecclesiastical offices was borne. In 1273, they were transformed into Canons Regular. The same partition of the Culdee revenues which appears at Abernethy, is found also at Brechin. A layman, who is abbot only in name, inherits a large share of the Culdee patrimony, and transmits it to his descendants, who soon lose even the name of abbot. The prior and his C., meanwhile, are absorbed into the chapter of the new bishopric, founded at Brechin by King David I., about 1145; in less than a hundred years, the name of C. disappears, and the chapter is one wholly of secular canons. The same silent change of C. into secular canons, which took place at Brechin during the 13th c., took place also at Dunblane, at Dunkeld, at Lismore, at Rossmarky, and at Dornoch. C. are found in the bishop's chapter at each of these places in the 12th c.; they disappear before the end of the 13th c., leaving the chapter one of secular canons. At Dunkeld, as at Brechin and at Abernethy, great part of the Culdee revenues was held by a lay-abbot, whose office was of such mark as to be hereditary in the royal family. The father of 'the gracious Duncan,' and the son of St. Margaret, were Culdee abbots. If a tradition of the 16th c. can be received as authority for what passed in the 12th c., the C. of Dunkeld were married, like the priests of the Greek Church, but lived apart from their wives during their period of service at the altar.

C. are found holding land at Monifieth, near Dundee, about 1200; and there was a lay-abbot of Monifieth; but there is nothing to show whether he was or was not a Culdee. The C. of Muthill, in Strathearn, appear with their prior in charters of the beginning of the 13th century. Nothing more is known of them. Jocelin of Furnes, in his life of St. Kentigern, or Mungo, written about the year 1180, relates that the disciples of that saint at Glasgow, in the 6th c., had all things in common, but lived each in his own hut, whence they were called 'solitary clerks,' and more commonly 'Culdees.' C. appear as one of the ecclesiastical fraternities of Iona in the year 1164; and the faint vestiges of a circular building (about 15 feet in diameter) called 'Cothan Cuildich,' or the Culdee's cell, are still shown in the island.

Only one or two traces of C. have been observed in England. The canons of St. Peter's, at York, were called C. in the reign of Æthelstan (924—931); and a charter of Æthelred, in the year 1005, speaks of the canons of the English cathedrals generally as *cultores clerici*. The term is of doubtful import, and the character itself is not beyond suspicion.

Of the C. in Wales, we have only one notice. Giraldus Cambrensis, writing about 1190, describes the island of Bardsey, on the coast of Caernarvon, as inhabited 'by most devout monks, called celibates or Culdees.'

Such is a concise recapitulation of all that is certainly known of the Culdees. Before their history was ascertained, opinions were held regarding them which now find few if any supporters among archæologists. It was believed that they were our first teachers of Christianity; that they came from the East before corruption had yet overspread the church; that they took the Scripture for their sole rule of faith; that they lived under a form of church government approaching to Presbyterian parity; that they rejected prelacy, transubstantiation, the invocation of saints, the veneration of relics, image-worship, and the celibacy of the clergy; and that they kept their simple worship and pure doctrines undefiled to the last, and were suppressed only by force and fraud, when the Roman Catholic Church triumphed over their older and better creed. For all this, it is now clearly seen that there is no foundation. There is no reason to suppose that the C. differed in any material point of faith, discipline, or ritual from the other clergy of the British islands and Western Christendom. Their name was their only peculiarity.

The best account of the Irish C. is given in a dissertation by the Rev. Dr. Reeves, in the *Proceedings of the Royal Irish Academy* for 1860. The best account of the Scottish C. is given in Mr. Grub's *Ecclesiastical History of Scotland*, vol. i. pp. 226—243 (Aberd. 1861.)

The opinions formerly held regarding the Scottish C. will be found in Selden's preface to the *Decem Historiæ Anglicanæ Scriptores*, reprinted in his *Opera*, vol. ii. pp. 1129—1146; Sir J. Dalrymple's *Collections concerning the Scottish History* (Edin. 1705); and the late Rev. Dr. Jamieson's *Historical Account of the Ancient Culdees* (Edin. 1811). The opinions of these writers are controverted in Bishop Lloyd's *Historical Account of Church Government*, chap. vii.; Goodall's *Preliminary Dissertation*, and Bishop Russell's *Supplement*, prefixed to Keith's *Catalogue of Scottish Bishops* (Edin. 1824); Pinkerton's *Inquiry into the Early History of Scotland*, vol. ii. pp. 270—273 (edit. 1814); and Chalmers's *Caledonia*, vol. i. pp. 434—439 (Lond. 1807). On the subject of the C. generally, reference may be made to Lanigan's *Ecclesiastical History of Ireland*, vol. iv.; to the dissertation by J. van Hecke in the *Acta Sanctorum Octobris*, vol. viii.; and to Skene's *Celtic Scotland*, vol. ii.

CU'LENBORG, CU'LEMBORG, or KUI'LENBURG, a town of the Netherlands, situated on the left bank of the river Leck, 12 miles north-west of Tiel. C. has three divisions, of which the inner town is the oldest and most important. It has a Reformed, a Lutheran, a Roman Catholic church, a synagogue, and a fine orphan-house. It has steam-boat communication, and is a station of the railway from Utrecht to 's Hertogenbosch. C. has several factories. In olden times, the 'Dominion of Culenborg' formed a county; and its independence, both of the Roman empire and the States of Holland, secured it the singular privilege of offering an asylum to fugitives from Holland for debt. Pop. (1880) 6725.

CULIACA'N, a town of the Mexican confederation, stands on a river of its own name, which, flowing towards the south-west, enters the Gulf of California near its mouth. It occupies a fertile tract in the department of Sinaloa, being about 90 miles to the south-east of the city so called. It is estimated to contain 7000 inhabitants.

CULILAWAN BARK, also called CLOVE BARK, a valuable aromatic bark, the product of the *Cinnamomum Culilawan*, a tree of the same genus with the Cinnamon (q. v.) tree, growing in the Molucca Islands. It comes to market in pieces of various length, almost flat, thick, fibrous, covered with a white epidermis, reddish-yellow inside, and has an odor resembling that of nutmeg and cloves, and a pungent taste. It is useful in cases of indigestion, diarrhœa, &c.—Another variety of C. B. is believed to be the produce of *Cinnamomum xanthoneurum*; and a very similar bark, called SINTOC BARK, is obtained from *C. Sintoc*.

CU'LLEN, a royal, parliamentary, and municipal burgh and seaport in the north of Banffshire, 12 miles west-north-west of Banff. It is built on the west slope of an eminence overlooking the sea, and at the mouth of the Cullen Burn. Pop. (1881) 2033. A third of the inhabitants of the town are engaged in the cod, ling, haddock, skate, herring, and salmon fisheries. C. contributes with Elgin, Banff, Peterhead, Inverury, and Kintore in returning one member to parliament. The chief exports are cured fish, oats, potatoes. Some linen is made. The Marquis of Montrose burned C. in 1645.

CULLEN, WILLIAM, a well-known physician of the last century, and one of the most celebrated professors of medicine in the universities of Edinburgh and Glasgow, was born at Hamilton, in Lanarkshire, on the 15th day of April 1710. His father was factor to the Duke of Hamilton, and was possessed of a little landed property in the parish of Bothwell; he appears to have brought up two of his sons to the learned professions, and to have himself received a legal education. William C. received the first part of his education at the grammar-school of Hamilton, and afterwards began his medical studies in Glasgow by an apprenticeship, and by attending literary classes in the university. At this time (about 1727), it does not appear that there was any systematic medical teaching in Glasgow University, though the medical school of Edinburgh was just rising to the height of its fame, under the auspices of the first Monro. C.'s master in the art, however, Mr. John Paisley, was a liberal and enlightened man, having a valuable library, of which the pupil may be presumed to have made good use. In 1729, having completed for the time his medical education, he was appointed surgeon to a merchant-ship, trading to the West Indies; and from this time till 1734, he was actively engaged in learning his profession practically in various situations, but without accepting any permanent responsibility. He next spent two additional winter sessions in Edinburgh in the regular study of medicine, and was one of the founders of that important Students' Association—since called the Royal Medical Society—the object of which was, and is, the advancement of the medical knowledge of the members by periodical discussions on subjects of interest connected with medical study. In 1736, he commenced practice at Hamilton, and very soon was largely employed, having secured from the first the influence and friendship of the Duke of Hamilton and of other persons of distinction. Soon after he became acquainted with William Hunter, afterwards the celebrated anatomist and obstetric professor, and brother of the still more celebrated John Hunter. See HUNTER, JOHN and WILLIAM. The three years passed by Hunter under Cullen's roof formed the beginning of a life-long friendship, although after Hunter went to London, it is probable that they never again met. In 1740 C. took the degree of Doctor of Medicine in the university of Glasgow; in 1741 he entered into partnership with a surgeon, with the view of confining himself to a physician's practice; in 1744, he responded to the invitation of a number of families in Glasgow, and took a house in that city, an object which it is probable he had in view some years before, but which he was prevented from carrying out by the friendship and liberal patronage of the Duke of Hamilton, who died in 1743. Various circumstances indicate that during the seven years passed in practice in Hamilton, C. was diligently preparing, not only for the practice, but also for the teaching, of his profession; and accordingly, he had no sooner settled in Glasgow, than we find him engaged in giving a course of lectures, in regard to which his correspondence with William Hunter sufficiently shows that it was successful, and deserved success. Up to this period, though professorships of medicine, and of anatomy with botany, existed in the university, no lectures were delivered in either medicine or botany; and it seems certain that to C. that university owes the real commencement of its medical school; for in one or two years succeeding 1746, he made arrangements with the several professors to lecture on the theory and practice of physic; on botany and the materia medica, and finally on chemistry, being assisted in these last departments by Mr. John Carrick, who also acted as assistant to the professor of anatomy. In botany, C. seems to have lectured in Latin, but in the other departments he adopted the English language as the vehicle of expression, an innovation of great importance, which permitted him to adopt a more familiar style of lecturing than had hitherto been in use. One of his original hearers records that 'in the physic class, Dr. Cullen never read lectures, but only used notes; in the chemistry, he sometimes read, but very seldom.' *

He was supported by the university by votes amounting to £136 for the chemical laboratory, and £20 annually for keeping it in repair. As a chemist, he does not appear to have made any notable discovery; but he imbued the minds of his pupils with large and liberal views of a science then very imperfectly studied, and was beyond all doubt the means of raising up the great reputation of Dr. Black, by turning his thoughts to the subject of Latent Heat, which he prosecuted so successfully by a series of conclusive and most original experiments. In 1751, after somewhat prolonged negotiations, C. was placed, through the influence of the Duke of Argyle, for the first time in his rightful position as a professor in the university of Glasgow, in room of Dr. Johnstone, the Professor of Medicine.

But by this time it had begun to be apparent that an opening both for teaching and practice existed in Edinburgh, and Lord Kames, whose knowledge both of general science and of Edinburgh society placed him in a favorable position for judging of the chances of success, made several attempts to attract the rising and ambitious Glasgow professor to the metropolis; in which design, however, he was not successful till four years afterwards, when C. was elected by the town-council joint Professor of Chemistry with Dr. Plummer, who had fallen into bad health, and who died about a year afterwards. In 1757, his ever-active mind found a new direction in adding to his duties as Professor of Chemistry the teaching of Clinical Medicine in the Royal Infirmary, a duty up to this period performed by Dr. Rutherford only, the Professor of Medicine and Botany. The clear-sightedness and practical sagacity which he brought to this work at once fixed his position as a teacher and as a physician. Probably, also, the fact of his having to give bedside instruction at this period opposed itself to the natural tendency of his mind to give everything a systematic form, and weeded his method of practice of an immense quantity of the scholastic rubbish which appears prominently in all the medical learning of that age. He became a decided favorite with the students, and not less so with his patients; and in 1760 was applied to by the former to undertake the lectures on materia medica, in consequence of the death of Dr. Alston during the session. This duty he performed so well that his lectures were surreptitiously printed from the notes of a pupil, and had a considerable circulation. On the resignation of Dr. Rutherford, it was reasonably expected that C. would have been transferred from the chemical chair to that of the Practice of Physic, for which he had shown so decided an aptitude; but personal views interfered, and Dr. John Gregory was appointed to the practical chair. In 1766, C. was, however, placed in the chair of Institutes of Medicine, vacant by the death of Dr. Whytt; and Black, now the greatest chemical discoverer of the age, was brought to Edinburgh from Glasgow to fill C.'s place as Professor of Chemistry. In 1773, C. was at last transferred to the chair of the Practice of Physic, the duties of which he had for some years performed alternately with Dr. Gregory, the latter taking part in return alternately with C. in the lectures on the Theory or Institutes of Medicine.

The rest of Dr. C.'s biography is simply a record of continued success as a teacher and a practitioner. His popularity with his students, and even his scientific reputation at one time threatened to be seriously diminished by the brief but noisy episode of the Brunonian system (see BROWN, JOHN, M.D.).

In 1778, C. became the proprietor of Ormiston Hill, a small but prettily situated property about eight miles west of Edinburgh, where he passed as much time as his professional duties would allow in improving his little estate, and renewing his long dormant knowledge of, and love for, rural affairs. 'I have got upon my hobby,' he writes to a friend; 'my amusement is a little farm, and a little pleasure-ground. . . . I have done a great deal, but it is all levelling work; other people cannot know what earth has been moved, but I have had some amusement in the turning of every shovelful.' It was a becoming end to a life of usefulness. He had here the leisure and enjoyment of life which were required to wean him from the too exclusive pursuit of his profession; and while his love of science never chilled, and was even made subservient to the adornment of the retreat of his old age, he was somewhat withdrawn from the heat and the strife of the world into the purer air of domestic retirement. C. died on the 5th February 1790, having nearly completed his 79th year, and having been actively engaged in teaching and consulting practice till within a few months of his death. His most important works are—the *First Lines of the Practice of Physic* (Edin. 1777); *Synopsis Nosologiæ Methodicæ*, 1785; *Institutions of Medicine*, 1777; *A Treatise of the Materia Medica*, 1789. Their characteristics are great clearness of expression, with remarkable soundness of judgment and common sense, rather than striking originality, or a rapid advance into new regions of thought. But he was eminently the man for his time, which was distracted and confused by a host of baseless theories, and by many of those 'false facts' which C. himself said were more numerous than even false theories. Amid this farrago, he sought his way towards the truth with remarkable impartiality, and infinite candor as regards the opinions of others. His fame as one of the greatest of teachers has survived the memory of his professional success, and even the credit of his far-famed systematic Nosology. His writings have been collected, in 2 vols. 8vo, by Dr. John Thomson (Edin. 1827), by whom also a Life was commenced, the first volume of which was published in 1832. This biography was continued by his son, and finally completed in a second volume by Dr. Craigie, in 1859.

* Thomson's *Life of Cullen*, vol. i. p. 25.

CULLE'RA, a fortified town of Spain, and port on the Mediterranean, 23 miles south-south-east of the town of Valencia. It stands near a very fertile district, and the inhabitants are mostly engaged in agriculture, cattle-rearing, fishing, and the production of oil and wine. Pop. (1877) 11,050.

CULLO'DEN, or DRUMMO'SSIE MOOR, a desolate level tableland, now partly cultivated, in the north-east of Inverness-shire, six miles east-north-east of Inverness, near the Moray Firth. It is memorable as the scene of the total defeat, on 16th April 1746, of the Highland army under Prince Charles Stuart by the royal troops under the Duke of Cumberland, and the extinction of the hopes of the House of Stuart to regain the English crown. Green mounds, and a cairn, with stones and inscriptions, mark the spots where the battle was fiercest, and where many of the slain lie buried.

CULM, in Botany, the peculiar cylindrical hollow and jointed stem of Grasses (q. v.).

CULM, a popular name of Anthracite (q. v.), in very general use in some parts of England, and occurring in many scientific works. In some districts of South Wales, the C., obtained from the pits in a broken and crumbling condition, is used as fuel, being made up into balls, with one-third of its bulk of wet viscid clay. It burns without flame, producing a strong and steady heat, well adapted for cooking.

CULMINA'TION, an astronomical term, signifying the passage of a star across the meridian. The star is then at the highest point (*culmen*) of its course: hence the name. The sun culminates at midday, or twelve o'clock, apparent solar time—which seldom agrees exactly with mean time, as shown by a watch or clock. The full moon culminates at midnight. The time of C. of a fixed star is always exactly midway between the times of its rising and setting; in the case of the sun, moon, and planets, it is only nearly so.

CU'LNA, a town of Bengal, 47 miles north of Calcutta, on the right bank of the Hooghly. The town contains a vast number of temples, is a station of the Free Church (Scotland) Mission, and has a flourishing English school. It is a place of considerable trade, rice, grain, silk and cotton being the chief articles of commerce. C., in 1871, had 27,336 inhabitants.

CU'LPA (Lat. fault, crime, blame). By the Roman jurists, C. was recognized as existing in three degrees: *C. lata*, gross carelessness or omission, which was regarded as equivalent to dole; *C. levis*, that degree of negligence into which a person attentive to his own affairs may be supposed occasionally to fall; and *C. levissima*, that still more slight degree of negligence which is in some degree incident to human nature, and may be fallen into by even the most prudent and sharp-sighted. Where a contract contemplates the mutual benefit of both parties, the middle degree of diligence is all that either is bound to exercise, and the neglect of this is *C. levis*, or C. simply. Where one party only is benefited, he is bound to exercise the utmost diligence, the neglect of which is *C. levissima*, whilst the other party has done enough if he avoids *C. lata*, or gross and excessive negligence. These distinctions of the Roman law have been adopted by the law of Scotland.

CULPABLE HO'MICIDE. See HOMICIDE and MURDER.

CU'LPRIT, in English law, is a prisoner accused, but not tried. After trial, if not acquitted, he becomes a convict.

CULRO'SS, a parliamentary and municipal burgh and seaport in a detached part of Perthshire, on the north shore of the Firth of Forth, 6 miles west of Dunfermline, and 22 north-north-west of Edinburgh. It is a place of great antiquity. As early as the 6th c., it was the seat of the monastery of St. Serf, who afterwards became the patron saint of the town, where his yearly festival was kept till about the close of the 18th century. Ængus the Keldee, an Irish martyrologist, who wrote about 800 A.D., describes it as lying in Strathearn, between the Ochils and the Sea of Gindan, i. e., the Firth of Forth. It stands on the face of a hill rising from the shore. The parish church preserves some remains of the conventual church of a Cistercian abbey, founded in 1217, on a commanding site in the higher part of the town. Close beside it is the fine old residence of C. Abbey, founded by the Bruces of Carnock and Kinloss about the end of the 16th c., remodelled about the middle of the 17th c., and towards the end of the 18th occupied by the father of the late Lord Dundonald, who here made experiments in extracting tar from coal for preserving ships' bottoms, and gas for illuminating purposes. At the east end of the town are the ruins of a chapel, built about the beginning of the 16th c., in honor of St. Kentigern or Mungo, who is said to have been born here about the year 500, and to have been here educated by St. Serf. C. has various charitable institutions, and carries on some damask weaving. In the 16th c. it was famous for the manufacture of salt and the export of coal. Its once extensive shipping-traffic is now gone. Pop. (1881) 373. It returns one member to parliament with Stirling, Dunfermline, Inverkeithing, and South Queensferry. From James VI.'s time, up till the beginning of this century, coal-mines were worked here far under the Firth of Forth.

CU'LTIVATED PLANTS—those plants which, either for their usefulness or their beauty, have been to some considerable extent, and not merely as objects of curiosity, cultivated by man—belong to natural orders widely different from each other, and scattered throughout almost all parts of the vegetable kingdom. The prevalence of particular qualities in particular natural orders, indeed, causes us to find groups of C. P. in some of them, as the *Cerealia* or corn-plants among grasses; but with these are botanically associated other species—usually far more numerous—to which no great value has ever been attached, or which are objects of interest to the botanist alone.

It may be that, in some instances, the original preference of certain species was accidental, and that their present superiority over certain others is merely owing to the improvements effected by cultivation; but we are no more entitled to assume that this has been ordinarily the case, than that man has in his selection exhausted, or nearly exhausted, the resources of nature. Some plants are known to have been cultivated from the most remote historic ages; some have but recently become the objects of human care, which yet are deservedly esteemed; and, in some instances—e. g., sea-kale—these have not been introduced from regions newly explored, but are natives of the very countries which have been the seats of ancient civilization. Probably, in the earliest ages, plants useful for food alone were cultivated, and of these only a few kinds, as is still the case among savage tribes; it may perhaps be doubted whether plants yielding fibre for clothing and cordage, or plants from which alcoholic beverages or narcotics could be procured, were most likely next to engage attention.—Of C. P., plants affording articles of human food are certainly the most important, as well as the most numerous class. See FOOD. Next to these may be ranked plants yielding FIBRE (q. v.). Other important classes of C. P. are those yielding alcoholic beverages, all of which, however, are also to be ranked among the plants yielding food (see FERMENTED LIQUORS); those yielding tea, coffee, cocoa, and other similar beverages, containing *Caffeine* (q. v.), or some other analagous principle; those yielding Narcotics (q. v.), as tobacco and opium, some of which are and some are not cultivated also for other purposes; those yielding Dye-stuffs (q. v.); those yielding medicines (see OFFICINAL PLANTS); those yielding fixed oils (see OILS), some of which are to be reckoned among plants valuable for food, on account of the use of their oils as articles of food, whilst they are also valuable on other accounts; those yielding Fodder (q. v.) for cattle; those yielding timber (see TIMBER TREES); those employed for Hedges (q. v.), &c. There are also many miscellaneous useful products of plants, and useful purposes to which they are applicable. Among the former are resins, turpentines, essential oils, gum, caoutchouc, gutta-percha, bark for tanning, &c.; among the latter, the thatching of roofs, basket-making, and the supply of food necessary for useful insects, which leads to the cultivation of the white mulberry as the food of the silkworm, and of the cochineal cactus or nopal as the food of the cochineal insect. Many plants highly valued for their usefulness are still scarcely or not at all cultivated; this is the case particularly with many that yield medicines, for which the whole demand is not too great to be easily supplied by the plants growing wild, and timber trees, the plantation of which only takes place in countries of very advanced civilization. The number of plants cultivated for their usefulnes is continually increasing, as well as of those cultivated for their beauty.

The cultivation of flowers and ornamental shrubs and trees, although unquestionably less ancient than that of some of the plants most necessary for the supply of urgent wants, nevertheless dates from a remote antiquity, and has always existed in every country entitled in any measure to the credit of civilization. Some C. P. have from a very early period been very widely diffused, as has particularly been the case with some of the corn-plants; but others have been confined to particular regions through no necessity of climatic adaptation, but rather from want of intercourse among nations. Thus, some of the finest ornaments of our green-houses and gardens, recently introduced into Europe, have been diligently cultivated from time immemorial in China and Japan, in which countries also many useful plants are cultivated still almost unknown in other parts of the world. The cultivation of useful aquatic plants is practised in China to a degree unapproached in any other country.

The changes produced by cultivation present an interesting and difficult subject to the student of vegetable physiology. Increase of luxuriance and size is a result which might have been expected from abundant nutriment and favorable circumstances of growth; but the determination of the strength of the plant in its vegetation to particular parts, and their greater proportionate increase, is a more remarkable phenomenon, although of common occurrence, as is also the considerable modification of juices and qualities. To these effects of cultivation, perpetuated in the progeny

of the plants, and increased from one generation to another, we owe many of the most useful varieties of cultivated plants. Our cabbages, turnips, carrots, &c., differ very much from the wild plants of the same species; there is little, for example, that is eatable or nutritious in the root of a wild turnip, and the acridity occasionally to be observed even in cultivation exists in it to a much greater degree. Wild celery is poisonous, or almost so. How far the effects of cultivation can be extended, is a question not yet decided in general, nor with reference to particular species.

CULTIVA'TION. The term includes all operations for preparing the soil for those crops which man specially selects for his use. The spade, the hoe, and the plough, have been the primary implements of C. among all nations as far back as their civilization can be traced. All these effect much the same end. By their means the soil is stirred and inverted, which keeps under the vegetation that is supplanted, and loosens the soil to admit of the roots of the sown plants to run through it. The harrow or rake, on the other hand, is employed to smooth the surface and cover the seed. To allow of the C. of the crops when they are growing, in many cases the seeds are planted or sown in rows.

Cereals, for instance, are, with this view, often sown with a *drill* in rows from six to nine inches apart; and the narrow rows are either cultivated by the *hand* or *horse hoe*. Again, turnips, potatoes, and other green crops are sown at wider intervals, from 24 to 30 inches, and are cultivated during their growth by horse-hoes of various descriptions. The implements used in C. will be best treated under their special names, and under the different crops the peculiarities of their cultivation will be considered. A few general principles, however, which ought to be kept in view in the C. of all crops, may be here stated.

The soil, in the first place, should be as completely inverted as possible, since it is an important object to smother or bury the surface-plants, and permit them to decay within the soil and yield food for the plants to be sown. In the second place, it should be rendered as loose and comminuted as possible; for earth in this state both allows an excess of water to pass through it more easily, and it also retains a larger supply within it for the wants of vegetation when the weather is dry. Land that is tilled in autumn may be left open, rough, and cloddy, as the frost of winter will loosen and pulverize it by spring. In a dry and warm climate, the desired state of the soil is secured by abundant ploughing, rolling, and other operations. In a wet and moist climate, these must be more sparingly resorted to, as a moderately rough mould facilitates the draining away of excessive rains, and prevents the soil from becoming consolidated by such excess.

CULTIVA'TOR, a farm implement. See GRUBBER.

CULTRIRO'STRÉS (Lat. knife-billed or ploughshare-billed), a tribe of birds of the order *Grallatores;* distinguished by a long, thick, stout, and generally pointed and trenchant bill, and containing Cranes, Herons, Bitterns, Storks, Adjutants, &c.

CU'LVERIN, among the earlier forms of cannon, was a very long gun. It was generally an 18-pounder, weighing 50 cwt.; the *demi*-C. was a 9-pounder, weighing 30 cwt. A C. of especially large dimensions is still in existence at Dover Castle, where it is known by the name of Queen Elizabeth's Pocket Pistol.

CU'LVERT is the name given to an arched channel of masonry for the conveyance of water underground.

CU'MÆ, an ancient city on the coast of Campania, founded conjointly by colonists from Chalcis in Eubœa, and from Cymæ in Asia Minor. According to Strabo, it was the earliest of all the Greek settlements either in Italy or Sicily, but the precise date of its foundation is a matter of dispute. It soon attained to wealth and power, built several harbors or port-towns of its own, kept a tolerably large fleet, extended its influence over the native tribes of the neighboring territories, planted a colony at Neapolis (Naples), and for 200 years (700—500 B.C.) was indisputably the most important and civilized city in Southern Italy. Subsequently, it was repeatedly but unsuccessfully attacked by the Etruscans and Umbrians.

In 474 B.C., its ally, Hieron, king of Syracuse, defeated the combined fleets of the Etruscans and Carthaginians, who had attacked it by sea. Yet there can be no doubt that these conflicts both lessened its resources and weakened its influence, for in 420 B.C., the Samnites conquered the city, murdered or enslaved most of the citizens, and forcibly married their wives and daughters. A Samnite colony was now established in C., which rapidly degenerated into a second-rate Campanian town. In 338 B.C., it was admitted to the Roman franchise, and from this period steadily adhered to the fortunes of Rome. In the second Punic war, Hannibal tried to capture it, but was repulsed by Sempronius Gracchus. Towards the close of the republic, it became the municipal capital of the district in which the Roman nobles had their villas and sea-coast residences. It continued to exist as a 'quiet' place down to the close of the Roman empire, but re-assumed a momentary importance during the wars of Belisarius and Narses. Its strong fortress, garrisoned by the Goths, was the last place in Italy that held out against the Byzantine army. Few remains of the ancient city exist.—C. is famous as the residence of the Sibyl (q. v.), whose cave—a vast subterranean grotto hewn out of the eastern side of the rock on which stood the citadel—is described by Justin Martyr, who visited it. It was destroyed by Narses in a vain attempt to undermine the fortress.

CUMANA', the oldest European city in the new world, having been built by Diego Castellon in 1521, and originally named New Toledo. It is in the province of the same name, in Venezuela, South America, and stands at the mouth of the Manzanares, on the Gulf of Cariaco, a long and narrow arm of the Caribbean Sea. Lat. 10° 30′ N., and long. 64° 15′ W. Though it was almost entirely destroyed by an earthquake in 1853, yet in 1873 it numbered, including several suburbs, 9427 inhabitants. It has a good roadstead, which is commanded by a fort on an adjacent height. It has but few edifices of any note, for the houses, in order to guard against the evil already mentioned, are generally low built. It carries on a tolerably large export trade in cattle, smoked meat, salt-fish, cocoa, and other provisions.

CUMANA, the department of which the above-mentioned city is the capital, forms the most easterly section of the northern coast of the republic, touching the Orinoco on the south, and meeting Caracas on the west. Besides the capital, it comprises the city of Barcelona, and the towns of Cariaco, Carapano, Aragua, and El Pao. Pop. (1873) 55,476.

CU'MBERLAND, the north-westmost county of England, bounded N. by Scotland and the Solway Firth, W. by the Irish Sea, S. by Lancashire, E. by Westmoreland, Durham, and Northumberland. It is 11th in size of the English counties; greatest length 74 miles; greatest average breadth, 22; 75 miles of coast; area, 1523 square miles; ⅔ being cultivated, and ⅓ in mountain and lake. The surface is mountainous in the south-west and east; the middle consists of hills, valleys, and elevated ridges; and the north and north-west districts, including the vale of Carlisle, are low, flat, or gently undulated. The mountains in the south-west are high, rugged, and sterile, with deep and narrow valleys, lakes, rivers, waterfalls, and woodlands. The chief mountains are Sca Fell Pike, 3210 feet; Sca Fell, 3162; Helvellyn, 3118; Skiddaw, 3054. From the latter are seen the German Ocean and the Irish Sea. The Pennine chain, the great backbone of the north of England, skirts the north-east border of C., and rises in Cross Fell, 2929 feet. C. has 15 lakes, the largest one, Ulleswater, being 9 miles by 1. Six of the chief waterfalls are 60 to 156 feet high. The chief rivers are the Eden, running 35 miles north-west into the Solway Firth; the Esk, running south into the same; and the Derwent, which collects the water of six lakes and several tarns, and runs 33 miles north-west and north into the Irish sea. The great west or Carlisle and Lancaster railway route from Edinburgh to London, crosses the north-east part of Cumberland.

The Lake district, or nearly the south-west half of C., consists of Silurian slates, with protrusions of granite and trap-rocks, and with new red sandstone along the coast south of St. Bees Head. In the north is a semicircular strip of carboniferous limestone; then follow strips of coal strata and Permian rocks; then the new red sandstone plain of Carlisle, with carboniferous limestone on the north-east, including a trap-dike 30 miles long, parallel to and on the east side of the Eden, and crossing to the west near Ainstable. C. abounds in mineral wealth—silver, copper, lead, iron, plumbago, gypsum, limestone, coal, slates, marbles, marl, and several of the more rare minerals.

In the mountainous parts, the climate is cold, wet, and variable, especially from July to October; on the coast, it is mild. There is a fall of 50 inches of rain annually at Whitehaven, and of 68 at Keswick; while at some places among the mountains the fall sometimes reaches 100 inches. Half of the cultivated soil consists of dry loam. Much of the subsoil is wet clay. The chief crops are wheat, barley, oats, turnips, and potatoes. There are many small dairies. Many sheep and cattle are reared in the mountains. The estates are generally small, and farmed by the owners, or held under the lords of the manors by customary tenure. Many of the small or peasant proprietors have had their lands in their families for centuries, and have a high spirit of independence.

There are manufactures of woollens—much being domestic—cottons, linen, earthenware, and glass. C. is divided into five wards or hundreds, 104 parishes, and nine poor-law unions. The chief towns are Carlisle, Cockermouth, Whitehaven, Workington, Maryport, Wigton, Penrith, Keswick, Egremont. Population at the census of 1871, 220,253; at that of 1881, 250,630. In 1880, the number of electors was 24,560. C. returns eight members to parliament—four for the county, two for Carlisle, one for Cockermouth, and one for Whitehaven. C. formed part of Cumbria (q. v.). Many Roman relics have been found, such as altars, inscriptions, coins, instruments, utensils. During Saxon times, it was under Danish law. Henry III. united it to England. For

three centuries before the union of England and Scotland, C. was the constant scene of war and devastation, from incursions of the English and Scotch into this, a debatable tract between the two kingdoms. It was again devastated in the civil wars of the 17th c., and in 1715 and 1745. C. had formerly several monasteries and hospitals; and on the borders, many towers or peel houses; and it has still some old Norman and Gothic churches.

CUMBERLAND, a river, rises in Kentucky, United States, and after a course of 600 miles, of which the lower half is navigable for vessels of 400 tons, enters the Ohio at Smithland from the left, a few miles above the point where the Tennessee also joins the Ohio from the same side.

CU'MBERLAND, a township of Rhode Island, U.S., on Blackstone River, 10 miles north of Providence, containing extensive manufactories of iron, machinery, cotton, boots and shoes, &c. Pop. (1880) 6445.

CUMBERLAND, a city of Maryland, U.S., on the left bank of the Potomac River, at the foot of the Alleghanies, 179 miles west-by-north from Baltimore. It contains county buildings, 8 churches, 3 newspapers, flour-mills, &c. The C. semi-bituminious coal is got in this district. Pop. (1870) 8056; (1880) 10,693.

CUMBERLAND, Dr. Richard, was born in London, July 13, 1632. Educated at St. Paul's School and at Cambridge, he was appointed to the rectory of Brampton, Northamptonshire, in 1658; in 1667, to the living of All Hallows, Stamford; and in 1691, to the bishopric of Peterborough. C. was a man of great acquirements and piety. He was the author of several works, but he is now chiefly remembered on account of his *Inquiry into the Laws of Nature*, issued in reply to Hobbes; and his *Essay on Jewish Weights and Measures*. As an instance of his insatiable thirst for knowledge, it is mentioned that he learned Coptic after the age of 83. He died October 9, 1718.

CUMBERLAND, Richard, a dramatic writer and essayist, was born on the 19th February 1732, in the lodge of Trinity College, Cambridge. He was the great-grandson of the Bishop of Peterborough, and grandson, by the mother's side, of Dr. Richard Bentley. He was placed at the public schools of Bury St. Edmunds and Westminster, and at the age of 14, was entered at Trinity College, Cambridge, where he took his degree in his 18th year, and two years after was elected a fellow. Having been appointed private secretary to the Earl of Halifax, he gave up his intention of entering the church, and passing through several subordinate offices, was appointed secretary to the Board of Trade, holding that office till 1782, when the Board was suppressed. Having obtained a compensation allowance, C. retired to Tunbridge Wells. Here he devoted himself to literature, and wrote farces, tragedies, comedies, pamphlets, essays, and novels. Many of his comedies were successful at the time of their appearance, although they have not kept possession of the stage. C. is best known as an essayist, and as a translator from the Greek poets. His memoirs were published in 1806, and he died in 1811.

CUMBERLAND, William Augustus, Duke of, second son of George II., was born 1721. He adopted a military career, was wounded at Dettingen in 1743, and defeated at Fontenoy by Marshal Saxe in 1745. In 1746 he defeated the Young Pretender at Culloden. In 1747, he was again defeated by Saxe (at Lafeldt), and in 1757 had to surrender and disarm his army at Klöster-Zeven. On his return to England, he felt compelled to resign his commissions, and died in 1765. See *Life* (1776) and *General Orders of* 1745—1747 (1876). The latter seems to show that his severity after Culloden has been exaggerated.

CUMBERLAND ISLAND, a large island with Davis Strait on the E., Hudson's Bay on the W., Hudson's Strait on the S., and on the W. a small strait separating it from Cockburn Island.

CUMBERLAND PRESBYTE'RIANS, a religious denomination which sprang up in 1810 in the state of Kentucky, in North America, in consequence of a dispute between the presbytery of Cumberland in that state, and the Kentucky Synod of the Presbyterian Church in America, concerning the ordination of persons who had not passed through the usual educational curriculum, but whose services the presbytery regarded as demanded for the ministry by the exigencies of the times. In 1880, this church had 26 synods, about 1320 ministers, and 107,000 members. Its doctrines agree with those of the other branches of the Presbyterian Church, except that the doctrine of universal redemption is held, and the predestination of sin denied.

CU'MBRAYS, or GREAT and LITTLE CUMBRAY, two small isles in the Firth of Clyde, between Bute Isle and Ayrshire, and included in the county of Bute. They consist of old red sandstone, with trap-dikes intersecting it. Great Cumbray lies three miles east of Bute, is 3½ miles long by two broad, has a pop. of (1881) 1856, contains Millport and Newton villages, and is a great summer resort of the inhabitants of Glasgow. Little Cumbray lies nearly a mile to the south of Great Cumbray, is one mile long by half a mile broad, and rises 780 feet; it contains many caves, excavated by the sea in the stratified rocks. Pop. (1881) 23.

CU'MBRÉ, La, the Spanish for top or height, is one of the principal passes across the Andes, on the high-road between Santiago in Chili and Mendoza in the Argentine Republic. The altitude of its crest is 12,454 feet, fully one half higher than the pass of the Great St. Bernard in the Alps.

CU'MBRIA, an ancient British principality, comprising Cumberland in England, and that part of Scotland which is now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburg, and Dumfries. It was governed by its own kings—who had their seat at Dumbarton, Glasgow, and elsewhere—until about the middle of the 10th c., when it became a tributary principality held of the king of the English, by the heir of the king of the Scots. See the article Bretts and Scots.

CU'MBRIAN MOUNTAINS, a great knot of mountains, nearly 50 miles in length and breadth, in the north-west of England, occupying part of Cumberland, Westmoreland, and Lancashire. This tract, the English Lake district, has much of the physical character of Wales, and being unsurpassed in the British Isles for picturesqueness and beauty, it is much frequented by tourists. The central and southern parts consist of Silurian, granite, and trap rocks, rising in lofty rugged mountains, which enclose deep valleys and large lakes. There are 25 mountain-tops upwards of 1500 feet high, including Sca Fell Pike, 3166 feet; Sca Fell, 3100; Helvellyn, 3055; and Skiddaw, 3022. Four passes cross these mountains at the height of from 1100 to 1250 feet. The deep valleys between the mountains contain 14 lakes, 1 to 10 miles long. The largest of the lakes are Windermere, Ulleswater, Conistone Water, Bassenthwaite Water, and Derwentwater. A semi-circular strip of carboniferous limestone skirts the north of the Silurian tract. On the higher C. M., snow lies six or eight months in the year, but on the neighboring coasts rarely above a few days. Many eminent persons have resided among the lakes, the beauty of which has inspired some of the finest writings of Wordsworth, Coleridge, Southey, Professor Wilson, De Quincey, Arnold, and Harriet Martineau.

CUMIA'NA, a town of North Italy, in the province of Turin, 7 miles north of Piñerolo, near the right bank of the Cisola. Pop. 5700.

CU'MMIN, or CU'MIN (*Cuminum*), a genus of plants of the natural order *Umbelliferæ*, containing only one known species (*C. cyminum*), a native of Egypt and the neighboring countries; an annual, with branched stem, much divided thread-like leaves, general and partial involucres resembling the leaves, umbels of small white or pink flowers, and fruit about two lines long. The fruit (seeds) has an odor resembling that of caraway, but stronger and less pleasant. It is employed as a carminative in many parts of the world; in Germany, it is often put into bread; in Holland, sometimes into cheese. It is also used in medicine, particularly with resin for discutient plasters, but its use is now chiefly confined to veterinary practice. It contains a peculiar volatile oil (*Oil of Cummin*). C. is cultivated in the south and middle of Europe, India, &c. C. seed is brought to Britain mostly from Sicily and Malta—The fruit of *Lagoecia cuminoides*, another umbelliferous plant, a native of the Levant, is similar in its qualities and uses to that of cummin. The Black C. of the ancients is believed to be a species of *Nigella* (q. v.). Both are perhaps included in the name C. in Scripture.

Cuminum Cyminum: *a*, fruit; *b*, section of fruit.

CU'MMING, Rev. Dr. John, a popular preacher and author, was born in Aberdeenshire, 10th November 1810, educated at King's College, Aberdeen, where he took his degree of M.A. in 1827, and, in 1833, was ordained to the Scotch Church, Crown Court, Covent Garden, London, where he officiated till a year or two before his death. His popularity as a preacher was very great, especially among 'fashionable' circles. In 1837, C. made his first prominent appearance in public in connection with the Voluntary controversy between Drs. Wardlaw and Chalmers. His views were strongly in favor of establishments. Afterwards he figured prominently on the platform, particularly as the 'cham-

pion' of the anti-popery class of Protestants. But the chief source of his popularity was his gift of apocalyptic interpretation. His exposition of the Book of Revelation was not very convincing to men who are moderately impressed with the grandeur, complexity, and mystery of the Divine Providence; but it was greatly relished, and greedily swallowed by that large portion of the community who love to see all things, even the 'oracles of God,' presented under melodramatic aspects. After some years of ill-health, C. died 5th June 1881.

C.'s works are very voluminous: the chief are *Voices of the Night*, *Voices of the Day*, *Voices of the Dead*, *Apocalyptic Sketches*, *Expository Readings in the Old and New Testament*, and *The Seventh Vial*.

CU'MNOCK, OLD, a town in the south-east of Ayreshire, on the left bank of Lugar Water, and on the Glasgow and Dumfries Railway, 16 miles east of Ayr, in the middle of the district of Kyle. The population, in 1881, was 3345. It was once famous for the manufacture of wooden snuff-boxes, with 'invisible wooden hinges,' 2500 to 3500 being made yearly, but this business has for many years been almost wholly in the hands of the Mauchline manufacturers. Around Old C. there is an abundant supply of good coal, and of rich iron ore. It has also manufactures of reaping and thrashing-machines, and other agricultural implements. New Cumnock is a village 5 miles south of Old C., amid the high lands in the upper part of Kyle district. Pop. (1881) 1265. Near New Cumnock are found ironstone, antimony, smiths' and cannel coal, and plumbago.

CU'MYN, CUMMING, or COMYN, a family which rose to great power and eminence in England and Scotland. It took its name from the town of Comines, near Lille, on the frontier between France and Belgium. While one branch remained there, and in 1445, gave birth, in its old château, to the historian Philippe de Comines (q. v.), another followed the banners of William of Normandy to the conquest of England. In 1069, the Conqueror sent Robert of Comines, or Comyn, with 700 horse to reduce the yet unsubdued provinces of the north. He seized Durham, but had not held it for 48 hours when the people suddenly rose against him, and he perished in the flames of the bishop's palace. His nephew, William, became Chancellor of Scotland about 1133, and nine years later, all but possessed himself of the see of Durham. The chancellor's nephew, Richard, inherited the English possessions of his family, and acquired lands in Scotland. By his marriage with Hexilda, Countess of Athol, the granddaughter of Donald Bane, king of the Scots, he had a son William, who, about 1210, became Earl of Buchan by marrying the Celtic heiress of that great northern earldom. By this marriage, he was father of Alexander, Earl of Buchan, who, by marrying a daughter of Roger de Quenci, Earl of Winchester, acquired the high office of Constable of Scotland, with great estates in Galloway, Fife, and the Lothians. By a previous marriage with a wife whose name has not been ascertained, William C. was father of Richard—whose son John became Lord of Badenoch—and of Walter, who by marriage became Earl of Monteith. By other marriages, the family obtained, for a time, the earldom of Angus, and the earldom of Athol, so that, by the middle of the 13th c., there were in Scotland 4 earls, 1 lord, and 32 belted knights of the name of Cumyn. Within 70 years, this great house was so utterly overthrown that, in the words of a contemporary chronicle, 'there was no memorial left of it in the land, save the orisons of the monks of Deer' (a monastery founded by William C., Earl of Buchan, in 1219). The Cumyns perished in the memorable revolution which placed Bruce on the throne of Scotland.

Their chief, the Lord of Badenoch, had, in 1291, been an unsuccessful competitor for the crown, as a descendant through king Donald Bane, of the old Celtic dynasty. His son, Red John C., was one of the three wardens of Scotland, and distinguished himself by his gallant resistance to the English. He fell under Bruce's dagger, before the altar of the Franciscan friars at Dumfries, in 1306; and his kindred went down, one after another, in the struggle to avenge him. John C., Earl of Buchan, was defeated by Bruce in a pitched battle near Inverury, in 1308, when his earldom was wasted with such relentless severity, that—we are told by the poet who sang the victories of Bruce—for sixty years afterwards, men mourned the desolation of Buchan. Such of the Cumyns as escaped the sword, found refuge with their wives and children, in England, where, although they were so poor as to be dependents on the bounty of the English court, they married into the best families, so that, in the words of Mr. Riddel, 'their blood at this day circulates through all that is noble in the sister kingdom.'

CUNARD, SIR SAMUEL, founder of the well-known line of Transatlantic steamers, was born in 1787 at Halifax, Nova Scotia, where his father, a French Canadian, had settled. Becoming early a successful merchant and shipowner, C. cherished the idea of steam communication between England and America; and having obtained a contract from the English government for the mail service, built four paddle-steamers for the Atlantic voyage. The first passage was that of the *Britannia* in 1840. From its small but successful beginning, C.'s undertaking soon developed into one of the vastest of private commercial concerns. Made a baronet in 1859, C. died at London, 28th April 1865.

CUNA'XA, a place in Babylonia, east of the Euphrates, about 60 miles north of Babylon, noted for the battle (401 B.C.) between Cyrus the younger and his brother Artaxerxes Mnemon, in which the former was killed.

CUNDINAMA'RCA, the central state of Colombia (formerly New Granada), has an area of 79,000 square miles, and a population (excluding Indians) of about 410,000. The western part is mountainous, with luxuriant valleys; in the east are vast plains. C. is well wooded, and rich in minerals. The capital of C. is Bogota, also capital of the republic. C. was one of the most highly civilized regions of the continent before the Spanish conquest; and ancient ruins are numerous.

CUNE'IFORM, Cuneatic, Wedge-shaped, Arrow-headed (Fr. Tête-à-clou, Ger. Keilförmig), are terms for a certain form of writing, of which the component parts may be said to resemble either a wedge, the barb of an arrow, or a nail. It was used for monumental records, and was either hewn or carved in rocks and sculptures, or impressed on tiles and bricks.

The first date that can be assigned to it is about 2000 B. C., and it seems to have died out shortly before or after the reign of Alexander the Great. It appears to have been employed first in Assyria and Media, and to have thence spread over the whole of that vast portion of Asia which formed the Persian monarchy under the Achæmenidæ. For nearly 2000 years after its extinction its very existence was forgotten. Although the immense ruins found all over that ancient kingdom, and principally those of splendid palaces and tombs, which, at a distance of about 12 miles from Shiraz, designate the site of ancient Persepolis, had at all times attracted the attention of Eastern travelers, still no one seems to have dreamed that those strange wedges which completely covered some of them could have any meaning. It was Garcia de Sylva Figuëroa, ambassador of Philip III. of Spain, who, on a visit to Persepolis in 1618, first became possessed with the firm conviction that these signs must be inscriptions in some lost writing and, perhaps, language, and had a line of them copied. Amongst subsequent travelers whose attention was attracted to the subject, Chardin, after his return to Europe in 1674, published three complete groups of cuneiforms, copied by himself at Persepolis, together with a comparatively long and minute account of the mysterious character. He likewise declared it to be 'writing and no hieroglyphs; the rest, however, will always be unknown.' Michaux, a French botanist, sent, in 1782, an entire altar, found at Bagdad, to Paris, covered with inscriptions, and bearing a large wedge—evidently an object of worship—on its top. Ever since, the materials for the investigation of a subject, the high importance of which by that time was fully recognized, have been rapidly accumulating. Sir H. Jones, Ker Porter, Robert Stewart, Sir W. Ouseley, Bellino, Dr. Schultz—up to Rich and Botta, Flandin, Rouet, Layard, Oppert, and, above all, Rawlinson, each in his turn brought back more or less valuable materials from his eastern travels; and, naturally enough, those explorers are among the foremost to engage in the study of the records they had brought to light.

Shrouded in comparative mystery though certain portions of these characters and the language they represent still be, it is highly interesting and instructive to notice the opinions first entertained of them by the wise and learned in Europe. In the Transactions of the Royal Society of June 1693, they first appeared from a copy made by Flowers, and they are held to be 'the ancient writing of the Gaures or Gebres, or a kind of *telesmes*'—an expression no less unintelligible than the subject it tries to explain. Thomas Hyde, the eminent Orientalist, declared them, in his learned work on the religion of the ancient Persians, which appeared in 1700, to be nothing more nor less than idle fancies of the architect, who endeavored to show how many different characters a certain peculiar stroke in different combinations could furnish, and reproved the authors of all those 'so-called Persepolitan inscriptions' very strongly for having misled so many wise men, and taken up so much of his own precious time.

Witte, in Rostock, saw in them the destructive work of generations upon generations of *worms*. Generally, they were pronounced to be talismanic signs, mysterious formulæ of priests, astrological symbols, charms, which, if properly read and used, would open immense vaults full of gold and pearls—an opinion widely diffused among the native *savans*. The next step was to see in them a species of revealed digital language, such as the Almighty had first used to Adam. Lichtenstein read in some of them certain passages from the Koran, written in Cufic, the ancient Arabic character; in others, a record of Tamerlane; and was only surprised that others should not have found this, the easiest and clearest reading, long before him. Kæmpfer was not quite sure whether they were

Chinese or Hebrew characters. That they were Runes, Oghams, Samaritan, Greek characters, were some of the soberest explanations.

It was Karsten Niebuhr who first showed the way, to the more sensible portion of the learned, out of this labyrinth of absurdities. Without attempting to read the character itself, he first of all established three distinct cuneiform alphabets instead of one, the letters of which seemed to outnumber those of all other languages together. The threefold inscriptions found at Persepolis he thus took to be transcripts of the same text in three alphabets, in a hitherto unknown language. Tychsen of Rostock (1798) and Münster of Copenhagen (1800), affirmed and further developed this conjecture. The latter went so far as to divide the characters and inscriptions into alphabetical, syllabic, and monogrammatical, and to assume two different languages—Zend for inscriptions of a religious, Pehlvi for those of a political character. The real and final discovery, however, is due to Grotefend of Hanover, and dates from 1802. On the 7th of September of that year, he laid the first cuneiform alphabet, with its equivalents, before the Academy of Göttingen—strangely enough, in the very same sitting in which Heyne gave an account of the first reading of hieroglyphs. The process by which Grotefend arrived at that wonderful result is so supremely interesting, that we cannot omit to sketch it briefly. He fixed upon a Persepolitan inscription of what was called the first class, and counted in it thirty promiscuously recurring groups or combinations of cuneiforms. These groups he concluded to be letters, and not words, as a syllabarium of thirty words could not be thought of in any language. Then, again, a certain oblique wedge, evidently a sign of division, which stood after three, four, five, up to eight or nine such groups or letters, must show the beginning or end, not of a phrase, but of a word. Tychsen and Münster had already pointed out a certain combination of seven characters as signifying the royal title. Grotefend adopted this opinion.

The word occurred here and there in the text, and after the first words of most of the inscriptions, twice; the second time with an appendage, which he concluded to be the termination of the genitive plural, and he translated these two words, without regard to their phonetic value, 'King of Kings.' He then, in comparing the words preceding the royal titles in two tablets, found them repeated in what he assumed to be a filial relation; thus: There were three distinct groups, words, or names, which we will call X, D, and H, and this is how they occurred: 1, X, King of Kings, son of D, King of Kings; 2, D, King of Kings, son of H; but the 3, H, was *not* followed by the word King. H, therefore, must have been the founder of the dynasty. Now the names themselves had to be found. Grotefend, unlike his predecessors, had no recourse to philology, but to archæology and history. The inscriptions in question were by that time proved to belong to the Achæmenian dynasty, founded by Hystaspes = group H. He was followed by Darius, 'King of Kings, son of Hystaspes,' or Darius Hystaspis = group D; he, again, by Xerxes, King of Kings, son of Darius, King of Kings = group X—and the problem was solved. It could not have been Cyrus and Cambyses, as the groups did not begin with the same sign (C); nor Cyrus and Artaxerxes, the first being too short for the group, the second too long—it could only be Darius, Xerxes, Hystaspes—of course, in the orthography of their, not of our time; and wherever in these names the same letters recurred, they were expressed by the same combinations of signs. A further proof of the correctness of the reading was furnished by a vase in Venice, bearing a cuneiform and a hieroglyphical inscription, which were both read at the same time independently 'Xerxes.' Innumerable difficulties, however, remained, and remain up to this moment. Grotefend had, after all, only read—and not altogether correctly—three names, which did not contain more than twelve letters—the rest being mere conjecture—and there were many more in this alphabet. The two other alphabets, with an infinite variety of letters, had hardly been properly approached yet. Moreover, the discovery of Grotefend was in itself so startling, so extraordinary and bold, that no one ventured to follow it up for the next 20 years, when H. Martin found the grammatical flexions of the plural and genitive case. We cannot now specify his further discoveries, or those of Rask, Burnouf, Lassen, Westergard, Beer, Jacquet, and others who followed; we will only say, that they mostly secured for themselves fame and name by rectifying or fixing one or two letters. The last and greatest of investigators of this first alphabet is Rawlinson, who not only first copied, but also read, the gigantic Behistun inscription—containing more than 1000 lines—of which more anon.

We now proceed to give what may be called the results of the investigations of the cuneiform character in general, up to this present moment; but we must warn the reader beforehand, that though much has been done, more remains to be done, and that a few years may change the whole aspect of cuneiform studies.

Cuneiform writing, as we said before, was used for monumental records only, a cursive writing—from right to left—being used for records of minor importance. The inscriptions are mostly found in three parallel columns or tablets, and are then translations of each other in different alphabets and languages, called respectively Persian, Median, and Assyrian; the Achæmenian Kings being obliged to make their decrees intelligible to the three principal nations under their sway, as in our days the Shah of Persia would use the Persian, Turkish, and Arabic languages, in order that he might be understood in Bagdad and Teheran.

The first of the three, the Persian—first, in so far as it always holds the place of honor—consists of 39 to 44 letters, and is the most recent of the three, the most ancient being the Assyrian. It is distinguished by the oblique stroke which divides its words. Its letters are composed of not more than five strokes or wedges placed side by side horizontally or perpendicularly, or both, never—with one exception—crossing each other. The language is pronounced by all investigators (save Gobineau), to be as near Sanscrit as possible, although not so refined, and to be the mother-language of modern Persian. It is only twice found by itself; all the other inscriptions are trilingual. The time of its use is confined to the years 570—370 B.C. The oldest instance of its employment is an inscription of Cyrus the Great at Pasargadæ; the most recent, that of Artaxerxes Ochus at Persepolis. The most important is that of Darius Hystaspis, in the great inscription of Behistun, which contains, besides genealogical records, a description of the extent of his power, the leading incidents of his reign, prayers to Ormuzd and the angels, and reference to the building of the palaces—the last two subjects generally forming the only contents of the other Persian inscriptions. The inscription of Artaxerxes Ochus is important, in so far as it traces his origin to the Achæmenidæ, through Arsames, grandfather of Darius. Most of these inscriptions occur at Persepolis, Behistun, Naksh-i-Rustam, and Hamadan.

The second kind is called the Median, because it takes the second place in the trilingual inscriptions, under the conquering Persians, but over the conquered Assyrians, and as the Medes stood somewhat in that relation to these two nations, that name was selected. Another name, 'Scythic,' has been proposed, or, by way of compromise, 'Medo-Scythic,' and the language—supposed to have been spoken by those innumerable Tartaro-Finnic tribes which occupied the center of Asia—has been pronounced to be a Turanian dialect. But the process of constructing out of such slender elements as Samojed and Ostiak words, a so-called 'Scythic,' is somewhat similar to the attempt of reconstructing Sanscrit from some detached and very doubtful French and English words. These inscriptions never occur by themselves (one instance again excepted), and being translations of the Persian records, about ninety names have been ascertained, and an alphabet of about 100 characters—combinations of a syllabic nature—has been established. The principal investigators of this character are Westergaard, De Saulcy, Hincks, Norris, and Oppert. Gobineau holds the language to be Huzvaresh, a mixture of Iranian and Semitic.

The third and most important is the Assyrian portion of the cuneiforms. The trilingual records gave the first clue to the deciphering of this character; but many original, more than a thousand years older, documents have since been found in Babylon, Nineveh, and other places near the Euphrates and Tigris, and even in Egypt. About 400 different signs have been distinguished on slabs, cylinders, barrels, prisms, of a phonetic, syllabic, and ideographic nature. Proper names are preceded by monograms, which give the same help to their readings as cartouches in hieroglyphics. Of those 400 signs, however, hardly one-tenth are known for certain. Proper names were found varied to about five times, and the characters themselves are both homophonous (same sound expressed by various signs) and polyphonous (same sign with various sounds). Five and more dialects have been distinguished in the language, which is decidedly Semitic (Gobineau takes it to be simply Arabic); and these dialects are supposed to have belonged either to different tribes or subsequent periods. It is this alphabet about which the greatest uncertainty and confusion prevail, for endless subdivisions, and even certain assumed grammatical forms, do not constitute a certainty. There is, however, a hope of its eventually being fully deciphered. A few years ago, the Asiatic Society submitted a cylinder of Tiglath-Pileser to four prominent investigators of the subject, and they independently read it nearly alike, with exception of the proper names, where they widely differed. As a proof of the enormous importance of this character for history, grammar, law, mythology, archæology, and antiquities generally, we will name some of the records of which Rawlinson, a few years ago, proposed the publication (now in progress): Chaldæan Legends (2000—1500 B.C.); Bricks from Kilehsergat, of the early Kings of Assur (1273—1100), in a character approaching the cursive; Annals of Tiglath-Pileser I. (1120 B.C.); Annals of Sardanapalus, of Shamas, father to the biblical Pul, of the biblical Pul and Semiramis, his wife, of Sargon, Sennacherib, Assur bani-Pal, son of Esarhaddon; Cylinder of Nebuchadnezzar; Cylinders containing the notice of Bel-

shazzar, &c.; besides syllabaries, vocabularies, mathematical and astronomical tablets, calendars and registers, and more than 1000 mythological tablets. Nay, if the Birs-Nimrud really stands on the foundations of the old tower of Babel, we might in the bricks excavated at these very foundations read the language spoken at the time 'when the whole earth was of one speech.'

As to the origin of the character, we will briefly state, in conclusion, that nothing certain is known, or is likely to be known for some time. It is not unlikely, however, that it was hieroglyphic, although neither the fishes nor the bees, which these letters are supposed to have been originally, seem to have more in their favor than the worms, which were said to be their unconscious authors.

The following is the opinion of Rawlinson on this point: 'That the employment of the cuneiform character originated in Assyria, while the system of writing to which it was adapted was borrowed from Egypt, will hardly admit of question. Whether the cuneiform letters, in their primitive shapes were intended like the hieroglyphs to represent actual objects, and were afterwards de-

Persian.

Scythic.

Assyrian.

graded to their present forms; or whether the point of departure was from the Hieratic, or perhaps the Demotic character, the first change from a picture to a sign having thus taken place before Assyria formed her alphabet, I will not undertake to decide; but the whole structure of the Assyrian graphic system evidently betrays an Egyptian origin. The alphabet is partly ideographic and partly phonetic, and the phonetic signs are in some cases syllabic, and in others literal. Where a sign represents a syllable, I conjecture that the syllable in question may have been the specific name of the object which the sign was supposed to depict.' For the opinion that the cuneiform characters were invented by the primitive Accadian inhabitants of Chaldæa (who spoke an agglutinative language), see the article ASSYRIA.

In order to give the reader some idea of the appearance of the cuneiform character, we subjoin the name of Darius (Dariyavas, Tariyavaus), written in the Persian, Scythic, and Assyrian alphabets:

For fuller information on this subject, see Rawlinson, *The Persian Cuneiform Inscription at Behistun deciphered and translated*, &c. (Journal As. Soc., 1846, &c.); Grotefend, *Erläuterungen der Keilinschriften aus Behistun* (Göttingen, 1854); Lassen u. Westergaard, *Ueber die Keilinschriften der ersten und zweiten Gattung* (Bonn, 1845); Hincks, *On the First and Second Kinds of Persepolitan Writing* (Transact. Roy. Ir. Soc., 1846); Norris, *Memoir on the Scythic Version of the Behistun Inscription* (Journ. As. Soc., 1853); Rawlinson, *A Commentary on the Cuneiform Inscriptions of Babylon and Assyria* (1850); Oppert, *Etudes Assyriennes* (Journal Asiatique, Paris, 1857); Rénan, *Critique*, &c. (Journ. d. Sav., Paris, 1859).

CU'NNINGHAM, ALLAN, poet and *littérateur*, was born in 1785, at Blackwood, in Dumfriesshire. The circumstances of his parents were humble. At the age of 11, C. was taken from school, and apprenticed to a stone-mason. He worked faithfully at his calling; but his spare time, and his evenings, were given to song and the collection of traditions. He first appeared in print as a contributor to Cromek's *Remains of Nithsdale and Galloway Song*. These contributions, purporting to be ancient ballads, were entirely the composition of the ingenious and ambitious stone-cutter. The publication gained him the acquaintance of Hogg and Sir Walter Scott. With the latter, 'Honest Allan' was always a prodigious favorite. On his removal to London, he became one of the best known writers for the *London Magazine*. He subsequently obtained a situation in Chantrey's studio as foreman, or confidential manager, and this office he held till his death. During his career, he wielded an indefatigable pen. He wrote novels, poems, and a drama. His principal prose works, apart from his fictitious narratives are *Lives of the Painters, a Life of Burns*, and a *Life of Sir David Wilkie*. He died in London on 21st Oct. 1842. As a Scotch poet, he ranks, perhaps, after James Hogg. His songs, although disfigured by false taste, mannerism, and a superabundance of ornament, have true lyrical impulse and movement.

CUNNINGHAM, PETER, son of Allan Cunningham, the poet (q. v.) (born 1816, died 1869), is known in literature as the author of *Handbook of London, Life of Drummond of Hawthornden, Life of Inigo Jones, Modern London*, &c.; as the editor of various English classics; and as a frequent contributor to periodicals.

CUNNINGHAM, WILLIAM, D.D., a distinguished Scotch theologian, was born in 1805, and ordained as a minister of the Church of Scotland in 1830. He took a prominent part in the discussions previous to the Disruption in 1843, and was one of those who left the Establishment to form the Free Church. In 1847, he became principal of the New (Free Church) College, Edinburgh. He died in 1861. He is the author of *Historic Theology in the Christian Church* (1862), *Reformers and Theology of the Reformation* (1862), and *Discourses on Church Principles* (1863).—See *Life of C.*, by Rainy and Mackenzie (1871).

CUNNINGHA'MIA, a genus of trees of the natural order *Coniferæ*, nearly allied in botanical characters to the true pines and firs, but in foliage having considerable resemblance to the Araucarias. *C. Sinenois* is an evergreen tree, with narrow ovato-lanceolate, stiff, and sharp-pointed leaves, common in China, but too tender for the climate of Britain.

CUP, DIVINATION BY, a mode of foretelling events, practised by the ancient Egyptians, and still prevailing in some of the rural districts of England and Scotland. One of the eastern methods consisted in throwing in small pieces of gold or silver leaf into a C. of water, in which also were placed precious stones, with certain characters engraved upon them. The infernal powers were then invoked, and returned answer, either in an intelligible voice, or by signs on the surface of the water, or by a representation in the C. of the person inquired about. By the modern method, a person's fortune is foretold by the disposition of the sediment in his tea-cup after pouring out the last of the liquid. Few people now, however, even among the most ignorant, have implicit faith in the oracle.

CU'PAR-A'NGUS, a town on the borders of Perthshire and Forfarshire, and partly in both, is situated on the left bank of the Isla, a tributary of the Tay, 12½ m. E. by N. from Perth, and 16 m. W.N.W. from Dundee. It lies between the Grampian and Sidlaw Hills, in the center of the valley of Strathmore, and from its position in this valley it is popularly called 'the capital of the How.' Pop. (1881) 2154. It has extensive linen manufactures, with a considerable traffic in timber. Near the town are the remains of two Roman camps, on one of which stand the ruins of a monastery, built in 1164 by Malcolm IV., and destroyed at the Reformation. Recent excavations have exhumed numerous richly-carved tombstones in the grave-yard contiguous to the parish church, evidently those that had marked the graves of the ancient dignitaries of the monastery. The abbey revenue in 1562 was £1234 14*s.* 9*d.* in money, and 182 chalders of victual. The classic hill of Dunsinane is situated about five miles to the south-west of C., and the dilapidated castle of the 'bold Piteur,' who fell in the battle of Killiecrankie, in 1689, is within a distance of two miles.

CUPAR-FIFE, a royal, parliamentary, and municipal burgh, and the county town of Fifeshire, near the middle of the peninsula of Fife, on the Eden, 9 miles from its mouth, 32½ miles north of Edinburgh, and 14½ south of Dundee. It lies in a beautiful vale, stretching east and west, with a range of hills on the south, and a fertile country, with wooded eminences, on the north. It consists chiefly of two streets at right angles with each other. Pop. (1881) 5010. The chief manufactures are linens, bricks, and earthenware. It contributes with St. Andrews, East and West Anstruther, Crail, Kilrenny, and Pittenweem, to return one member to parliament. A fortress of the Macduffs, thanes of Fife, once stood on a mound called the Castle Hill, at the east end of the town. In former times, religious shows, mysteries, or moralities, were acted on a green esplanade in front of the castle, still called the Play-field. There also was acted the *Three Estates*, a celebrated satire on the priesthood, which hastened the religious revolution, and was written by Sir David Lindsay, whose estate of the Mount was near the town.

CU'PEL. See CUPELLATION.

CUPELLA'TION is the process of the separation of one metal from another (as lead from silver) by the use of a CUPEL highly heated in a muffle furnace. See ASSAY.

CU'PID, one of the gods of the classic mythology, whose name in Latin signifies *Desire*. The genealogy of this meddlesome divinity is rather confused. Sometimes he is represented as the son of Vulcan and Venus, or of Mars and Venus, while at other times the mythologists seem at a loss to name his father, and make him spring from the sea-foam, like Venus herself. As among the Greeks, the myth of Eros gave birth to numerous *Erotes* or Loves, so at Rome, also, that of C. originated a legion of Cupids, who all possessed the same attributes as their prototype. Every one knows what these were: the bow, arrows, quiver, and wings. Often a bandage covered the eyes. The appearance was that of a chubby child, or youth with a malicious smile. His darts could pierce the

fish at the bottom of the sea, the birds in the air, and the gods in Olympus. The immensity of space was his home, but like his mother, he specially loved the flowery thickets of Cyprus.

CU'POLA (Ital., from the root of *cup*), a spherical vault, or concave ceiling, on the top of a building. Cupolas are hemispherical, or of any other curve, and often consist of glass, so as to form a window in the roof. See DOME.

CUPPING is the application of cups, from which the air has been exhausted, to the skin, with the object of causing congestion or excessive fulness of the cutaneous blood-vessels; and if it should be thought desirable to withdraw some blood, the skin may be cut or scarified, and the exhausted cups applied over the incisions, to favor its flow.

C. has been a part of surgical practice from the earliest times, and instruments for performing it have been found in use among the least civilized nations. Of old, the cups were either small horns, open at both ends, from which the air was withdrawn by suction at the narrow extremity, or glasses of various shapes, with a small hole in the bottom of each. This hole was plugged with wax, the air exhausted by heat, and when the operator wished to remove them, he withdrew the plug, and allowed the air to enter. The modern cups are of glass, with round or oval mouths, and closed bottoms. Some have small sockets for holding cotton wick in their interior.

The principal improvements have been in the methods of incising the skin. This used to be effected with a common lancet or narrow knife, with a short blade and convex edge, set in a long elastic handle, which the operator struck rapidly with his finger, so as to drive the blade 26 or 30 times into the skin.

This was so tedious an operation, that a number of similar blades were used at once. These are contained in a box, which has slits pierced in it corresponding to the number of blades; the latter can be caused to emerge at these slits by turning a handle, or more rapidly by setting free a spring, which causes them to revolve suddenly, and in doing so protrude at the slits more or less, according to the will of the operator. The operation is thus performed: The scarificator, glasses, torch, spirits of wine, and a lighted candle are placed ready at hand; the part is sponged with hot water, so as to cause an increased flow of blood into it, then dried with a warm towel; the torch, previously saturated with the spirits of wine and lighted, is held for an instant in one of the glasses, which is now clapped on to the skin. The number of glasses depends on the quantity of blood it is thought desirable to abstract; each one will probably withdraw from three to five ounces. When the skin under the glass has become red and swollen, the cupper removes it, applies the scarificator, and as rapidly as possible again exhausts the air from the glass, and claps it on again. The blood will now flow into it; and when enough has been taken, the glass is removed, and some lint applied to the wounds. This apparently simple proceeding requires considerable skill, so that C. is practised as a separate profession in large towns, and the medical boards of the public services require that candidates for their appointments should produce a certificate of having received special instruction in the art. The difficulties consist in regulating the depth of the cuts, for should they be either too deep or too shallow, the blood will not flow. If the glasses be completely exhausted of air, their rims hurt the patient, and the blood will not flow, and it has happened that arteries or large veins have been wounded by ignorant operators.

There are many modifications of the ordinary C. apparatus, but all on the same principle.

Dry C. is simply applying the cups as described, but not wounding the skin. The ancients had a high opinion of this method, as they believed the 'noxious humors' were drawn forth of the body into the cups; and it need scarcely be added that extempore cups may be found in tumblers, finger-glasses, or any air-tight vessel with a smooth rim.

CU'PULE (*Cupula*), in Botany, a sort of cup formed by a number of cohering bracts, and surrounding the fruit or the base of the fruit in certain plants; as the oak, in which it is the cup of the acorn, and the hazel, in which it is the husk of the nut.

CUPULI'FERÆ (i. e., cupule-bearing), or CORYLACEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives of temperate climates. The leaves are alternate and furnished with stipules. The male flowers, and sometimes also the female flowers, are disposed in catkins (and this order is regarded by many botanists as a sub-order of AMENTACEÆ, q. v.); the stamens are 5—20, inserted into the base of scales or of a membranous perianth; the ovary is crowned by the rudiments of a persistent perianth, and surrounded by a Cupule (q. v.) of various figure; there are several cells and ovules, but the greater part of the ovules are abortive; the fruit is a 1-celled nut, more or less enclosed in the cupule; the seed is usually solitary; the embryo large, with fleshy cotyledons and minute superior radicle.—This order contains many of the most important trees of Europe and America, including all the different kinds of Oak, Beech, Chestnut, and Hazel, the Hornbeam, &c. Many species are also natives of tropical countries, but they are only found at considerable elevations.

CUR (Welsh *cor*, a dwarf, anything small; *coravon*, a small river; *corgi*, a small dog), a name sometimes applied indiscriminately to small dogs of any kind not highly valued, and in this way often particularly appropriated to dogs of mongrel breed, but also used by naturalists as the common designation of many races, of which the Terriers (q. v.) may be considered as the type; all of them small size, and exhibiting in a high degree the capacity for domestication along with activity and sagacity. These races are distributed over all parts of the world, and differ very considerably from each other, and are found domesticated even among very rude and savage tribes. The Pariah dog of India is reckoned among them, and exists in that country both in a wild and in a domesticated state; its body is more lank than that of the cur races of Europe, a character which is also in some measure exhibited by the dogs that haunt the streets of towns in Turkey, Persia, &c. The curs may, not improbably, have been the first domesticated dogs.

CURAÇA'O is the most important of the Dutch West India Islands which lie near the northern coast of Venezuela, in the Carribean Sea. Pop. (1880) Curaçao, 24,146; Bonaire, 4906; Aruba, 6204; Netherlands part of St. Martin, 3142; St. Eustatius, 2097; and Saba, 1955. Entire pop. 42,530, all free. The capital of C. is Willemstad, a very handsome town situated on the bay of St. Anna, and having 13,000 inhabitants. The soil of C. and its dependent islands is less productive than that of other tropical lands. The exports are maize, beans, cattle, salt, phosphate of lime, red dyewood, charcoal, bricks, and fruits. Goat, kid, and deer skins are exported in large numbers. Provisions have to be imported, to some extent, so poor is the soil; though tamarinds, bananas, cacao, oranges, sugar, tobacco, and maize are grown. The trade is mainly with the United States. C. (which is also spelled *Curaçoa* and *Curassou*) was discovered by Spain in 1527, taken by the Dutch in 1634, conquered by the English in 1807, and restored to Holland in 1815.

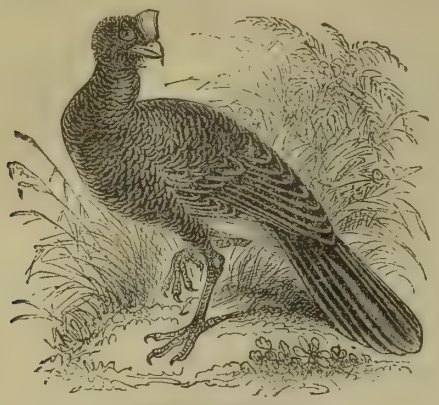
CURAÇO'A is a well-known and esteemed liqueur, made either from the small oranges called C. oranges, or from orange-peel, by digesting in sweetened spirits, along with a little cinnamon, and often a little mace or cloves. The spirits used are generally reduced to about 56 under proof, and contain about 3½ pounds of sugar per gallon. C. is often colored by digesting in it for a week or ten days a little powdered Brazil wood, and mellowing the color by means of burned sugar.

CURAÇOA ORANGES, small oranges which have fallen from the trees long before maturity. They have properties similar to those of orange-peel, but are more bitter and acrid, and are used for the same purposes.

CURARI, OURARI, WOORALI, or WOORARA, a celebrated poison used by some tribes of South American Indians for poisoning their arrows. It is by means of this poison that the small arrows shot from the Blowpipe (q. v.) become so deadly. The nature and source of this poison remained long unknown, the Indians being very unwilling to reveal the secret, which seems, however, to have been at last obtained from them by Sir Robert Schomburgk, and it is now regarded as pretty certain that the principal ingredient is the juice of the *Strychnos toxifera*, a tree or shrub of the same genus with that which yields nux vomica. See STRYCHNOS. It has a climbing stem, thickly covered with long spreading reddish hairs; rough, ovate, pointed leaves, and large, round fruit. The poison, when introduced into the blood, acts on the nervous system, and produces paralysis, with convulsive movements, and death ensues. It is supposed to be the most powerful sedative in nature. Artificial respiration is the most efficacious means of preventing its effects. It has been proposed to employ it in the cure of lockjaw and hydrophobia, and it has recently been asserted, as the result of experiment, that it can be very beneficially employed in the former disease. Like snake-poison it is comparatively inert when taken into the stomach. See WOORALI.

CURA'SSOW, or HO'CCO (*Crax*), a genus of large gallinaceous birds of the family *Cracidæ*, having a strong bill surrounded at the base with a skin—sometimes brightly colored—in which the nostrils are pierced, and the head adorned with a crest of feathers curled forward, which can be raised and depressed at pleasure. The species, which are not numerous, are natives of the forests of the warm parts of America. They congregate in flocks, and although they live much among the branches of trees, their habits greatly resemble those of domestic poultry. They are very unsuspicious of danger, until taught by severe experience; and are easily domesticated. The best known species (*C. Alector*) is about the size of a turkey, its plumage is almost entirely black. It is

abundant in the forests of Guiana. Its flesh is very good eating. It is kept in poultry-yards in South America, and was introduced into Holland at the close of last century, where it seemed com-



Galeated Curassow.

pletely acclimated, but the stock was lost midst the troubles which ensued on the French Revolution.

CU'RATE, literally, one who has the cure (Lat. *cura*, care) of souls, in which sense it is used in the Church of England Prayer-book, 'all bishops and curates.' It is, however, generally used to denote the humblest degree in the Church of England. A. C., in this sense, is a minister employed by the incumbent of a church (rector or vicar), either as assistant to him in the same church, or else in a chapel of ease within the parish belonging to the mother church. He must be licensed and admitted by the bishop of the diocese, or by an ordinary having episcopal jurisdiction, who also usually appoints his salary. Any C. that has no fixed estate in his curacy, not being instituted and inducted, may be removed at pleasure by the bishop or incumbent. But there are *perpetual* curates as well as temporary, who are appointed where tithes are impropriate and no vicarage was ever endowed: these are not removable, and the impropriators are obliged to maintain them. In general, the salaries of curates, certainly the hardest-worked, and not the least devoted of the English clergy, are shamefully small, and reform in this matter is urgently required.

CURA'TOR TO A MINOR. See GUARDIAN.

CURB (in horses) consists of strain of the straight ligament which runs down the back of the hock; is most common in animals with straight small hocks and that conformation known as *sickle hams;* whilst like other strains it occurs from sudden and violent exertion, often proceeding in the lighter breeds from leaping or galloping in heavy ground, and in the heavier, from the effort of keeping back a load whilst going down a steep incline. Swelling appears on the inner and back part of the joint, generally causing lameness, which is most apparent in trotting, and, in slight cases, usually wears off after the animal has been out for ten minutes. Fomentations must first be used to allay the irritation and inflammation; when heat and tenderness disappear, cold applications will be advisable; when, after ten days, the enlargement still continues, a blister may be necessary; whilst, from the first, all work must be forbidden.

CURCAS. See PHYSIC NUT.

CURCU'LIO. See WEEVIL.

CURCU'MA (Arab. *kurkum*), a genus of plants of the natural order *Scitamineæ*, having the tube of the corolla gradually enlarged upwards, and the limb two-lipped, each lip three-parted. The species are stemless plants, with palmate tuberous roots, natives of the East Indies. The dried roots of some are the Zedoary (q. v.) of the shops; the roots of others yield Turmeric (q. v.); and some yield a kind of Arrow-root (q. v.). The same species often yields both arrow-root and turmeric, the former being obtained from the young roots, the latter from the old.—*C. Amada* is called MANGO GINGER. Its root when fresh has the smell of a mango, and in its qualities resembles ginger. It is a native of Bengal.

CU'RFEW (Fr. *couvre-feu*, cover fire). To William the Conqueror is ascribed the introduction of the C. bell into England, the object of which was to warn the people to cover up their fires, and retire to rest. The time for ringing these bells was sunset in summer, and about 8 o'clock in winter; and certain penalties were imposed upon those who did not attend to the signal. The practice of ringing the C. bell, however, appears to have prevailed throughout Europe long before the era of the Norman Conquest, its object being the laudable one of preventing fires, which, owing to houses being chiefly composed of wood, were then both frequent and destructive. The custom of ringing the C. bell at eight or nine o'clock, is still continued in many parts of England, though its original significance is of course lost.

CU'RIA MU'RIA ISLANDS. See KOORIA MOORIA ISLANDS.

CU'RISCHES HAFF. See KURISCHES HAFF.

CU'RLEW (*Numenius*), a genus of birds of the order *Grallatores*, and of the same family (*Scolopacidæ*) with the snipe, woodcock, avocet, stilt, godwit, &c. The bill is long, slender, curved, and compressed; the face and head are feathered; the legs are slender, and part of the *tibia* is naked as well as the shank; the tail is short, and the folded wings extend about as far as the tail. The Common C. (*N. arquata*), the *Whaup* of the Scotch, is a bird of wide geographic distribution, being found in tropical, temperate, and arctic regions of the Old World and in Australia. It is common in Britain, frequenting the sea-shores in winter, and elevated moors in summer. Its peculiar cry or whistle is among the well-known characteristics of many upland scenes. It feeds on worms, molluscs, and insects. Its long bill enables it to seek its food in marshy or boggy ground. It builds a slight nest of leaves or other dry materials, in some tuft of rushes or among long grass or heath, in which four eggs are laid. The C. is good eating.—The WHIMBREL (*phæopus*) is a smaller species of C., much re-

Commun Curlew (*Numenius arquata*).

sembling the Common Curlew. It is also very widely distributed in the Old World; it frequently occurs on the shores of Britain, but seems to breed only in the most northerly moors. North America has several species of C., some of which extend their summer migrations to very northerly regions. The ESQUIMAUX C. (*N. borealis*) is sometimes seen migrating in dense flocks.

CURLING, a sport on the ice common in Scotland, where it is played by all classes of people in winter. Frozen-over lakes and rivers answer for the purpose, but under the auspices of C. clubs, artificial shallow ponds are maintained for the sake of this popular national sport, and these *bonspiels*, or set matches, are contested with immense spirit. The sport is regulated by a body of rules issued by a central association called the Caledonian Curling Club, which has grand matches in which hundreds are engaged at least once, if possible, every winter.

The remarkable and pleasing peculiarity of C. is, that it produces for the time a thorough mingling of ranks—peers, peasants, clergymen, farmers, country gentlemen and tradesmen, all mingling hilariously and familiar for the occasion. The sport belongs more particularly to the south-western division of Scotland. Latterly, it has migrated to England, Canada, and other countries where Scotsmen can find ice of sufficient strength and keenness. C. is played with flattish round stones, about nine inches in diameter, prepared by stone-hewers, each stone weighing from 30 to 45 lbs. Each of the players has a pair. The stones are provided with handles, to enable the player to hurl them on the ice with a proper degree of force. As at bowls, the stones are hurled to an assigned point or mark. The game is as follows: Sides are made up, usually consisting of four against four, with a director styled *skip* for each; after which a certain length of ice, of from 30 to 40 yards in length, and 8 or 9 feet across, is chosen. This is called the *rink*. Certain marks are then made at each end of the rink, consisting of several concentric rings, called *broughs*, and a center, called the *tee*. A certain number is game, usually 31, and the keenness displayed by rival sides in competing for victory, is perhaps without a parallel in any other pastime whatever. One on each side plays alternately. The chief object of the player is to hurl his stone along the ice, towards the tee with proper strength and precision; and on the skill displayed by the players in placing their own stones in favorable positions, or in driving rival stones out of favorable positions, depends nearly all the interest of the game. At a certain distance from each of the tees, a score—the *hog-score*—is drawn across the ice; and any stone not driven beyond this mark, counts nothing, and is laid aside. In country places, a dinner composed of 'beef and greens,' the

well-known curler's fare, generally concludes the day's diversion, which, taking place when out-door labor is suspended, is felt to be no encroachment on rural occupations. For laws and regulations of C., and general remarks on the game, see *Chambers's Information for the People*, article 'Out-of-Door Recreations.'

CU'RRACH, COURACH, or CO'RACLE (Celt. *corwg*, *curach*; Lat. *curuca*, *carrocium*, *carabus*), the name given in the British islands to a canoe or boat, made of a slender frame of wood, covered with skins. Skiffs of this sort, as well as canoes hollowed out of the trunks of oaks, were in use among the Britons in the earliest times of which we have record. Julius Cæsar, who built some of them after the British model, tells us that the keel and gunwales were of light wood, and the sides of wicker, covered with hides. Similar descriptions of the C. are given by Piny, Lucan, Solinus, Festus Avienus, Sidonius Apollinaris, and others. The first occurrence of the name seems to be in Gildas, who wrote in the 6th c.; he speaks of the C. as in use among the Scots and the Picts. A long voyage in the North Sea, made in a C., during the same century, by one of the companions of St. Columba, is commemorated by Adamnan, who died in 704. In 878, three Irish missionaries sailed in a C. from Ireland to Cornwall; the voyage occupied seven days; and the size of the C. is indicated by the remark that it was one of two skins and a half. An old life of St. Patrick speaks of a C. 'of one skin, with neither helm nor oar.' The C. of a larger size had a mast and sail. The C. still continues to be used on the Severn, and on many parts of the Irish coast, especially on the shores of Clare and Donegal. The last C. known to have been used in Scotland is in the museum at Elgin. It was employed on the Spey, towards the end of last century. Shaw, whose *History of Moray* was published in 1775, when the C. had become rare, thus describes it: 'It is in shape oval, near three feet broad, and four long; a small keel runs from the head to the stern; a few ribs are placed across the keel, and a ring of pliable wood around the lip of the machine. The whole is covered with the rough hide of an ox or a horse; the seat is in the middle; it carries but one person, or, if a second goes into it to be wafted over a river, he stands behind the rower, leaning on his shoulders. In floating timber, a rope is fixed to the float, and the rower holds it in one hand, and with the other manages the paddle. He keeps the float in deep water, and brings it to shore when he will. In returning home, he carries the machine on his shoulders, or on a horse.' One who figures in the *Dunciad*—Aaron Hill the poet—by showing the Strathspey Highlanders how to make their timber into a navigable raft, hastened the disappearance of the C. from Scotland. A description of the C., as still used in Ireland, will be found in the *Ulster Journal of Archæology*, vol. i. p. 32. A boat of bison skin, essentially the same with the British coracle, is in use among some of the Indians of North America.

Modern Coracle.

CU'RRAN, JOHN PHILPOT, a celebrated legal and parliamentary orator, born at Newmarket in the county of Cork, Ireland, July 24, 1750; was educated at Trinity College, Dublin; and in 1773, having resolved to adopt the law as a profession, went to London and entered himself at the Middle Temple. Two years after, he was called to the Irish bar, where his humorous, flowery, and sarcastic speech secured him immediate success, which his attractive social qualities did much to extend. In 1782, he obtained a seat in the Irish parliament as member for Kilbeggan, his general policy being in unison with that of Mr. Grattan and the few other liberal members who were then in the House. In debate, C. was usually charged with the reply to opponents, for which important duty his ready speech and cutting retort admirably qualified him. But his sarcasm led him into several duels, in which fortunately little harm was done on either side. In 1788, he was in favor of the formation of Irish volunteers; and in subsequent years, he was constant and eloquent in his appeals to government to adopt a different policy towards Ireland, as that which it was pursuing was likely to drive the people to rebellion. Government gave no heed, and the rebellion of 1798 was the consequence. C. had retired from parliament before the Union, of which he was a warm opponent. He was appointed Master of the Rolls in Ireland in 1806, an office he held until 1813, when he resigned. He died in London, October 14, 1817. C. is best remembered for his wit and gaiety, of which many excellent examples are preserved in the various Memoirs, Recollections, &c., of him which have been published.

CURRANT, a name originally belonging to a small kind of grape (see CURRANTS), and transferred, in consequence of the similar size of the fruit, to many species of the genus *Ribes*, the most important and almost the only genus of the natural order *Grossulariaceæ*. The species known as *currants* are destitute of spines, and have the flowers in racemes: the spiny species are known by the name GOOSEBERRY (q. v.). Among the fruit shrubs most generally cultivated in our gardens is the RED C. (*R. rubrum*), *Grosseille* of the French, a native of woods and thickets in the south of Europe, found also in some parts of Asia and of North America, perhaps rather a naturalized than a truly native plant in Britain. It has long been cultivated, although it does not appear that it had a place in the gardens of the ancient Greeks or Romans. The berries, besides being used for dessert, and to a much greater extent for pies, and for making jelly, are used also for making an agreeable and refreshing beverage, called in France *Eau de Grosseilles* (made of the juice of the fruit, water and sugar, strained, and iced), and a well-known fermented liquor called *Currant Wine* (q. v.).—The WHITE C. is a mere variety of the Red, the result of cultivation, with fruit less acid, and more fit for dessert, generally also rather larger.

There are many sub-varieties, and many intermediate shades of color. Both the Red and the White Currants are either trained as standard bushes, or against walls, the latter treatment producing larger and finer fruit, and both are sometimes trained on a north wall, to retard their ripening, till after the ordinary season. They grow readily, like the shrubs of this genus in general, from cuttings.—The BLACK C. (*R. nigrum*), *Cassis* of the French, grows in moist woods, and on the banks of streams in Europe and the North of Asia. The fruit is much larger than the Red C., and cultivation has lately produced varieties remarkable for size. There is a variety found in Russia with yellow berries. The Black C. is not so much cultivated in Germany and Holland as the Red, and is comparatively neglected even in England, but is to be found in almost every garden in Scotland. The jelly and preserve made from it are very useful for sore throats, as is also *Black C. Vinegar*, made in the same manner as Raspberry Vinegar. In Russia, the berries are gathered in large quantities in the woods, and dried in ovens, to be used in pies. They are tonic, and also slightly diuretic and sudorific. A liqueur, called *Liqueur de Cassis*, is prepared in France from the Black C., the manufacture of which has recently acquired a great importance in the Côte d'Or and neighboring departments. The town of Dijon contains more than thirty manufactories, and produced recently, in one year, not less than 220,000 gallons, the wholesale price of which—of the best quality—was equal to 2*s*. 9*d*. per quart. Large tracts of land are planted with the Black C. to supply the liqueur manufactories. It has very reasonably been suggested that the experiment of the introduction of this manufacture should be made in Scotland, and even in the Hebrides and Shetland Islands, where the Black C. perhaps grows as luxuriantly, and bears fruit as abundantly as in any part of the world.—Many other species of C., producing berries somewhat similar to those of the species so extensively cultivated, and some of them probably deserving of attention and cultivation, are found in temperate and cold climates in almost all parts of the world. One with beautiful red berries, larger than the largest English Red C., occurs on the Himalaya at an elevation of 13,000 feet.—The RED-FLOWERED C. (*R. sanguineum*), now so common as an ornamental bush in shrubberies, and trained on walls, producing in April a profusion of deep-red flowers in large drooping racemes, is a native of the north-west of America, and was introduced into Britain in 1826. Its bluish-black, mucilaginous, insipid berries are not, as is popularly believed, poisonous.—The GOLDEN C. (*R. aureum*), also a very ornamental shrub, from the same regions, has a tubular calyx and long golden yellow flowers. Its fruit, which is either yellow or black, and of fine flavor, is not freely produced in Britain.—The name NATIVE C., or AUSTRALIAN C., is given in Australia to the berries of different shrubs, particularly the white berries of *Leucopogon Richei*, of the natural order *Epacridaceæ* (q. v.).

The French naturalist Riche, who was attached to D'Entrecasteaux's expedition, mainly supported himself on these berries for three days, when he had been lost by his companions. Other fruits bearing the same name are produced by species of *Coprosma* (nat. ord. *Cinchonaceæ*), but they are very inferior.

CURRANT WINE is made of the juice of red or white currants, to which is added about one pint of water for every four pints of berries employed. About a pound and a half of sugar is afterwards added to each pint of the liquor, a little spirits being generally also added, before it is set aside to ferment. A larger quantity of sugar is sometimes employed, and no water, and a stronger and sweeter C. W. is thus produced. Fermentation requires several weeks, and the wine is not fit for use for at least some months afterwards. Black C. W. is made in the same way from black currants, but the fruit is put on the fire in as small a quantity of water as possible, and heated to the boiling-point before it is bruised. C. W., well made, may fairly challenge comparison with many products of the grape.

CURRANTS, a small kind of raisin (*Passulæ minores*), are the dried red or blue berries of a small-fruited seedless variety of the

common vine, which is cultivated in the East, and especially in Greece. The name is derived from the city of Corinth, in the neighborhood of which they were first cultivated. They are very small, round, with a thin skin, without seeds, and very sweet. Those brought from the island of Zante are most esteemed. They are much used by bakers and cooks, entering into the composition of many kinds of cakes, puddings, &c. They are a principal article of export from Greece, and the failure of the crop is severely felt in that country; whilst an increase of the price of C. is regarded as a disagreeable occurrence by the housewives of Britain. C. are simply dried in the sun, on the ground, and then packed into barrels. In a few districts of Greece, a very sweet oily wine, called currant wine, is made from currants.

CU'RRENCY means originally the capacity of being current, or, as Johnson defines it, 'the power of passing from hand to hand.' It is applied in practice to the thing that is so current, and generally to whatever, by being current among any nation or class of persons, serves as the money with which they buy commodities or pay their debts. It is necessary to be content with a practical explanation, without venturing on a scientific definition of the term, because, among the many disputed points in political economy, there is none productive of more exciting controversy than the proper regulation of the C.; and as the advocate of each theory is apt to define the term in the manner best suited to serve his own ultimate conclusions, his adversaries generally deny that his definition is sound. Whether correctly or not, it is applied in practice to everything that is received for payment. It differs from the word money, in its general acceptation, in as far as it expresses only that which passes as money at some time or place referred to.

The leading question among political economists regarding C. is, how far it should be restrained. The most effectual method of restraining it is by confining it to the precious metals. If it were law that none but a gold C. should be used in any country, and if, at the same time, there were no efforts to tamper with this gold C., and give it an artificial value, the C. of that country would keep its value all the world over, because it has been paid for in commodities, and will be sold again whenever it is in excess of the needs of those who use it. But for this very reason, it is a very expensive C., and therefore, ever since man's ingenuity was turned to trade, methods have been devised for superseding gold or the other precious metals by something cheaper. Unless, however, law or custom intervenes to give it efficiency, this cheaper material will only be worth its own intrinsic value. A five-pound Bank of England note is worth so little in its intrinsic value as a picture upon thin paper, that such a value can hardly be expressed. It derives its power as C. from the obligation it fixes on a great rich corporation to make good its professed amount to the holder. We thus pass from a purely bullion C. to the next step of restraint, which is generally called a mixed currency. Here some maintain that no note should be issued unless the banker or other person issuing it has in his possession as much bullion as will pay it. Others say it is sufficient that he is bound to pay its amount in bullion on demand without his actually possessing the bullion throughout the whole period of the C. of the note. A third party, again, are for a C. entirely free of a metallic basis; they hold that naturally paper-money, passing from hand to hand, will represent transactions, and will therefore come in the end to be made good in some shape or other; and they further hold, that if some losses should thus occur, these will be more than compensated by the rapid increase of trade and enterprise, caused by a free trade in C., as it is termed —that is to say, by every man issuing his own notes or promises to pay to whoever will take them. This last and extreme class of 'currency doctors,' as they have been termed, have lately been losing influence, and disappearing from the contest. Through a succession of practical measures, reached with considerable caution, the English have come to a mixed C., resting on a compromise between the two classes of mixed C. above referred to. In the theory of the measures brought to completion under Sir Robert Peel in 1844, it is admitted that, to a certain extent, a C. can be based on transactions and the property of those concerned in them, but that a limit must be drawn, to prevent the power of creating such a C. from running to excess, by the issue of notes which cannot be immediately made good by those who issue them.

Accordingly, the several banks in existence were allowed to continue their note circulation, but they were permitted to increase it only on the condition of having bullion in their coffers to pay the additional notes issued by them. A C. which is not bullion, and is not worth its nominal value in bullion, is called a 'depreciated currency.' Before the resumption of cash payments, the notes of the Bank of England had sunk to be worth but 16*s.* in the pound, as compared with gold. A depreciated C. may be created by a government calling notes or any other form of money a legal standard, and issuing a greater quantity of them than the real transactions of the country and the property passing from hand to hand require; or it may be created by private persons acting under laws by which the right of issuing a C. is not duly limited. This faculty which a C. has of being depreciated without being repudiated, is the real source of danger in all proposals for an unfettered C., or a free trade in the issue of money. If the bank-notes for which bullion cannot be immediately obtained were repudiated, there might be a natural check on over-issues; but it is their nature, on account of the difficulty of getting bullion for them, or the chance that it may never be got, that they pass at a discount or reduction of their value. Hence such a C. would be ever shifting; there would be no permanent standard, and the person incurring a debt before a depreciation which he pays afterwards would, in reality, be paying his creditor a dividend only. A depreciated C., however, is useful for small transactions. In the silver C. of this country, a pound is worth a little more than four-fifths of a sovereign. If a person due £100 could pay it in silver, he would get off with a dividend of from 16*s.* to 18*s.* in the pound; but by law, silver is not a legal tender for more than 40*s.* The copper C. is so far below its real value, that it has not been thought worth while to give it a permanent weight—the pence and halfpence now issued are little more than half the weight of those of former mintages; but they are only used as a medium for small sums, and the royal stamp is sufficient to establish a reliance on them.

CU'RRENTS. See GULF STREAM, TIDES.

CU'RRIE, DR. JAMES, best known for his valuable edition of Burns's works, long the basis of all subsequent editions, was born in Dumfriesshire, May 31, 1756. He was at first educated for a mercantile life, but afterwards studied medicine at Edinburgh University; and settling in Liverpool in 1781, soon obtained a good practice. He contributed some excellent papers to medical journals, but his chief work in connection with his profession was, *Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Febrile Disease*, the recommendations in which work have been followed with much success. The edition of Burns (introduced by a criticism on his writings), which he undertook solely for the benefit of the widow and children of the poet, was published in 1800, and realized £1400. C. died August 31, 1805.

CU'RRY-COMB. A kind of scraper used for dressing horses. It consists of a number of iron plates notched on one edge to form rough teeth. These plates are fastened in parallel lines to an iron back, to which a handle is attached, and the horse is 'curried' by scrubbing with the teeth.

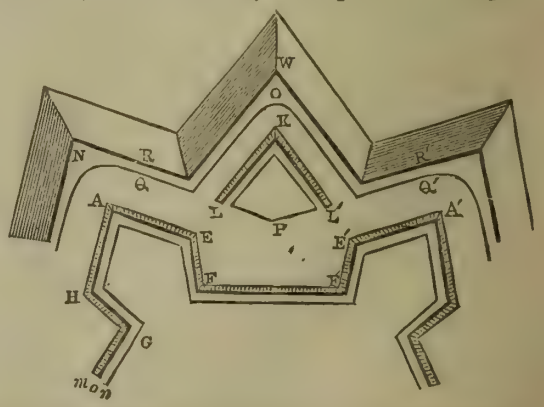
CURRYING. See LEATHER.

CURRY POWDER, or CURRY PASTE, is a compound of turmeric and various spices; it is used to a large extent in India and elsewhere as a seasoning for a variety of dishes. One of the best receipts for the compounding of C. P. is, turmeric powder, 6 oz.; coriander seed powder, 8 oz.; black pepper, 4 oz.; fenugreek, 2 oz.; ginger, 2 oz.; cayenne pepper, ½ oz.; cummin seed, ½ oz. Another process is to mix turmeric powder, 5 oz; coriander seed powder, 3 oz,; black pepper 1 oz.; ginger 1 oz.; cayenne pepper 1 oz.; scorched mustard, 2 oz.; mace, 2 drachms. And a third variety is obtained from turmeric powder, 8 oz.; coriander seed powder, 4 oz.; black pepper, 1 oz.; cayenne pepper, 1 oz.; scorched mustard, ½ oz.; mace, 1 drachm; cinnamon, 1 drachm; cardamoms, 2 drachms.

CURSE OF SCOTLAND, a term applied to the *nine of diamonds* in a pack of playing-cards. Much uncertainty prevails respecting the origin of this phrase. The most probable explanation is, that it refers to the detestation entertained in Scotland towards John Dalrymple, first Earl of Stair, on account of his concern in the Massacre of Glencoe, and for which he had to resign office, 1695. The heraldic bearing of this personage was 'or, on a saltire azure, nine lozenges of the field.' These nine lozenges resemble the nine of diamonds, and hence the popular phrase, the curse of Scotland.

CURSING. See INCANTATION, SWEARING.

CU'RTAIN, in Fortification, is the portion of rampart or wall



between two bastions or two gates. In a regular siege, to batter

down the C. is one of the main operations depended on; and many of the external works constructed by the defenders are intended to frustrate, or at least embarrass, this operation. In the annexed cut, which shows a ground-plan of some of the elements of a regular fortification, FF′ is the *curtain;* HAEF, a *bastion.* The component parts of the bastion are thus designated; AH and AE, two *faces;* EF and GH, two *flanks;* A, the *salient;* FG, the *gorge;* and H and E, the *shoulders. mn* is the *rampart; mo,* the *parapet* on the rampart; QPQ′, the *ditch;* NO, the *covert-way;* RWR′, the *glacis;* KLL′, a *ravelin.*

CURTIUS, Ernest, a distinguished German philologist and antiquary, born September 2, 1814, at Lübeck. After a good preliminary education at the High School of that place, he attended several German universities (Bonn, Göttingen, and Berlin) as a student of philology. In further pursuance of the path he had chosen—viz., the investigation of Greek antiquity—he went (1837), in company with Professor Brandis, to Athens, where he stayed several years. When his teacher, O. Müller (q. v.), came to Athens, C. accompanied him in his travels through Greece. On the death of Müller at Athens, in 1840, C. returned to Germany, visiting many places in Italy by the way. He graduated in Halle, and after he had taught for some time at two Berlin gymnasiums, he received an extraordinary professorship at the university of that place. His *Anecdota Delphica Inscriptiones Atticæ Duodecim,* and *The Acropolis of Athens,* were published about this time. In 1844, he became tutor to the present Crown-prince of Prussia. Six years later he returned to his academical office; in 1856 he was called to Göttingen; and in 1863 he was made Ordinary Professor at Berlin, and permanent Secretary of the Academy of Sciences. In 1874, he was sent by the German government to negotiate a treaty with the Greeks, to permit its undertaking those important excavations at Olympia, begun in 1875. His principal works are *Peloponnesos* (1852), a description of the country of Greece, with reference to its traditions, history, and monuments; *Attic Studies* (1864); and a *History of Greece,* which has been translated into English by A. W. Ward (1868—1876).

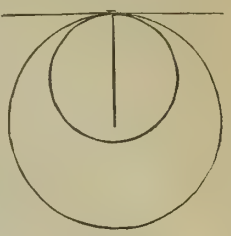
CURTIUS, Georg, a distinguished classical scholar, the brother of the former, who has acquired a high reputation for the light he has thrown on the Greek and Latin languages, by applying to them the comparative method. Born April 16, 1820, at Lübeck, he studied at Berlin and Bonn. After a short activity at Berlin, and a longer stay at Prague and Kiel Universities, he accepted (1862) the Professorship of Classical Philology at Leipzig. Of his published works are to be noted, *De Nominum Græcorum Formatione* (Berl. 1842); *Die Sprachvergleichung in ihrem Verhältniss zur Classischen Philologie* (Dresd. 1845); *Sprachvergleichende Beiträge zur Gr. und Lat. Gram.* (Berl. 1846); *De Nomine Homeri* (Kiel, 1855). His *Griech. Schulgrammatik* (11th ed., 1875) is in high repute, and his *Grundzüge der Griech. Etymologie* (Leipzig, 1862) is a most valuable contribution to that department of philology (Eng. trans., 1878).

CU′RTIUS, Mettus or Metius, a noble Roman youth who (according to tradition) heroically sacrificed his life for the welfare of his country, 362 B.C. A chasm, it is said, had opened in the forum, and the soothsayers predicted that some great calamity would happen if there were not thrown into it the best wealth of the state. While it was proposed to consult the oracles, and determine what this best wealth could be, C. appeared on horseback and in full armor, and exclaimed: 'Rome has no greater riches than courage and arms.' He then rode into the chasm, which immediately closed over him.

CURTIUS, Rufus Quintus, a Roman historian, author of the work *De Rebus Gestis Alexandri Magni,* in ten books, of which the first two have been lost, and the text of the remainder has come down to us in a damaged condition. Great differences of opinion have existed with regard to the time in which C. wrote, for his name is first mentioned by writers after the 12th century. Some critics have supposed that C. lived in the reign of Augustus; others, that he wrote in the 2d c., or under Constantine or Theodosius; while some regard the work ascribed to C. as a composition of the 13th century. The most probable opinion is that he flourished in the time of Vespasian. The value of the work is as dubious as its authorship. C. had a very inaccurate knowledge of geography, chronology, military tactics, astronomy, and historic criticism; hence his work is far from being reliable as a whole. The style, though declamatory, is on the whole pure and elegant. The first edition of C.'s history was published at Venice about 1471. Among modern editions may be mentioned Mutzell's (Berlin, 1841) and Zumpt's (Brunswick, 1849).

CU′RUKU OIL, or BRAHMADU′NDU OIL, a pale yellow, limpid oil, obtained in large quantities in India from the seeds of the *Argemone* (q. v.) *Mexicana,* or Prickly Poppy, a plant accidentally introduced, but which now flourishes luxuriantly in all parts of India. It is used for lamps, and for other purposes, but possesses properties which render it unfit for food.

CU′RVATURE. The C. of a plane curve at a point is its tendency to depart from a tangent to the curve at that point. In the circle, this tendency is the same throughout, for the curve is perfectly symmetrical round its center; in other words, the C. of a circle is constant. In different circles, the C. is inversely as the radius—i. e., it diminishes as the radius increases. The reciprocal of the radius is accordingly assumed as the measure of C. of a circle. A straight line, which has no C., may be considered part of a circle whose radius equals infinity as the reciprocal of infinity, measures the C., and is = 0. The annexed fig. shows how the circle of smaller radius bends more rapidly away from the tangent than that of larger radius.

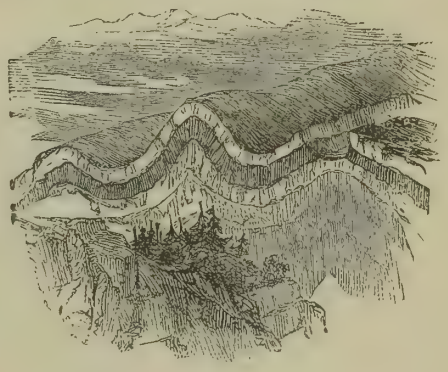


The constancy of C. in the circle suggests an absolute measure of C. at any point in the other curve; for whatever be the C. at that point, we can always find a circle of the same curvature. The radius of the circle which has the same C. at any point in a curve as the curve itself at that point, is called the radius of C. of the curve for that point; and the circle itself is called the *osculating* circle. If we know the radius of C. of a curve at different points, we can compare its C. at those points. We have thus the means also of comparing degrees of C. in different curves.

The problem of measuring the C. of a curve at any point is the same, then, with that of finding its radius of curvature. In some simple cases, as in the conic sections, this may be done geometrically; it is usually necessary, however, to employ the calculus. If the curve be referred to rectangular co-ordinates, and x, y be a point in it, then it can be shown that radius of C. $= \frac{\left(1+\frac{dy^2}{dx^2}\right)^{\frac{3}{2}}}{\frac{d^2y}{dx^2}}$.

If the curved line, instead of being plane, twists in space, it is called a curve of double curvature. See Contact and Osculation.

CURVES, Anticlinal and Synclinal, are terms applied to the elevations or depressions in undulating strata. The ridge-wave is called the anticlinal curve, and the top of the ridge is



known as the anticlinal axis; whilst the trough is the synclinal curve, and the bottom of the trough the synclinal axis. In the annexed section of the Jura Mountains, three anticlinal and two synclinal axes are seen.

CURVE means, in common language, a crooked line that departs gradually from the straight direction; in mathematics, however, it is usually restricted to lines that follow some law in their change of direction. Thus, the law of the circle is, that all points of it are equally distant from a fixed point, called the center. The law of a plane curve is generally expressed by an equation between the co-ordinates of any point in it referred to a fixed point. See Co-ordinates. When the equation of a curve contains only powers of x and y, the curve is algebraic; when the equation contains other functions, logarithms, for instance, of x and y, the curve is called transcendental. The cycloid, e. g., is a transcendental curve.

There are also curves, like the spiral, that do not continue in one plane; these are called curves of double curvature. To express the law of such a curve requires three co-ordinates and two equations.—Curves are said to be of the first, second, third, &c., order, according as their equations involve the first, second, third powers of x or y. The circle, ellipse, parabola, and hyperbola are of the second order of curves. There is only one line of the first order, namely, the straight line, which is also reckoned among the curves.—The higher geometry investigates the amount of curvature of curves, their length, the surface they enclose, &c.

The number of curves that might be drawn is of course infinite. A large number have received names, and are objects of great interest to the mathematician—in some cases for their beauty, in others, for their remarkable properties. Among the most interesting are the following: 1, circle; 2, ellipse; 3, hyperbola; 4, parabola; 5, cissoid of Diocles; 6, conchoid of Nicomedes; 7, lemniscata; 8, cycloid; 9, harmonic curve; 10, trochoid; 11, the witch; 12, cardiode; 13, curves of circular functions—e. g., curve of sines; 14, the logarithmic curve; 15, the spiral of Archimedes; 16, the catenary; 17, the tractory; 18, the tractrix; 19, the ovals of Cassini; 20, the reciprocal spiral.

CU'RZOLA (ancient, *Corcyra Nigra*, so called from the sombre color of its pine forests), an island of the Adriatic, forming a part of the Austrian crown-land of Dalmatia, lat. 42° 57′ N., long. 17° E. It has a length of about 25 miles, with an average breadth of 4 miles. It is well covered with wood, which on the south coast grows down to the water-edge. The woods furnish ship-timber, a considerable quantity of wine is raised, and the fisheries of the coast are productive. The population numbers altogether 11,000, about 2000 of whom are located in the town of C., at the north-east extremity of the island.

CUSCUS. See LEMON GRASS.

CUSCUTACEÆ. See DODDER.

CUSHAT. See PIGEON.

CUSP (Lat. *cuspis*, the point) is a point in a curve at which its two branches have a common tangent. If we conceive a curve to be generated by a moving point, then a C. is where the point suddenly stops and *returns* for a time in the same general direction as that in which it was moving when it reached the C. point.

Cusps are of two kinds: 1, when the two branches, AB, AC, have their convexities turned in the same direction with respect to

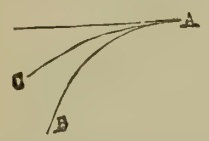


Fig. 1.

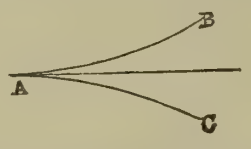

Fig. 2.

the common tangent at the C. point, as in fig. 1; 2, when they have their convexities turned in opposite directions to the common tangent at the C. point, as in fig. 2.

CUSP, in Architecture, is the point formed by the meeting of two small arches, or foils, in foil arches (q. v.), or tracery. Cusps often terminate in rich bosses of flowers and leaves.

Cusp.

CUSSO, KOSSO, or CABOTZ (*Brayera anthelmintica*, or *Hagenia Abyssinica*), a small Abyssinian tree of the natural order *Rosaceæ*, sub-order *Spiraceæ*, the dried flowers of which have been long used in Abyssinia as an anthelmintic, and have been found so efficacious in the removal of tape-worm, that they are now a much valued medicine in Europe. The flowers are simply dried, in order to be ready for the market; they have an

Cusso:—A, a branch, with leaves and flowers; B, a flower seen laterally; C, a female flower; *a*, *b*, *c*, *d*, *e*, the five outer segments of the calyx.

aromatic, but not very agreeable smell, and are administered in the form of an infusion.

CU'STARD, a composition of milk or cream, eggs, &c., sweetened with sugar, and flavored according to taste. Custards are of various kinds, such as plain, baked, lemon, orange, almond, coffee custards, &c. For a plain C., the following is a recipe as given by M. Soyer: Mix a pint of boiling milk with two ounces of sugar and the thin yellow peel of half a lemon; then take four eggs, beat well in basin, and add gradually the milk, &c. (not too hot); pass the mixture through a colander, and, having filled the custard cups with it, place them over the fire in a stew-pan containing about one inch of hot water, and leave them here until sufficiently set (about twelve minutes is the time required).

With this as a basis, a variety of custards are produced by the simple addition of flavoring ingredients, as almonds, orange-peel, &c.

CUSTARD APPLE, the name commonly given in the West Indies and other tropical countries to the fruits of certain species of *Anona*, a genus of trees of the natural order *Anonaceæ* (q. v.). Some of the fruits of this genus are among the most delicious produced in tropical countries, as the Cherimoyer (q. v.), and even the common C. A. (*A. reticulata*), which is regarded as a native of America, but is now very common throughout the East Indies, the variety cultivated in the Eastern Archipelago being very superior even to the West Indian. The C. A. is a large, dark-brown, roundish fruit, sometimes from its size and appearance called Bullock's Heart in the West Indies; the tree is of considerable size. Some other American species of *Anona* are sometimes called custard apples, and two or three which are natives of Western Africa. To this genus also belong the Sweet-sop, the Sour-sop, the Pinana or Pinha, all of them tropical American fruits, and the ALLIGATOR APPLE of the West Indies (*A. palustris*), a fruit of pleasant taste, but regarded as dangerously narcotic.

Custard Apple (*Anona triloba.*)

CU'STODY. See IMPRISONMENT.

CU'STOM, in English Law. This is either general or particular. The principal doctrines relating to general customs have been stated under COMMON LAW. Of particular customs, it may be remarked that, in order to establish them as law, they must be proved by verdict of a jury, except the C. of the city of London, which is proved by certificate by the lord mayor, aldermen, and recorder. A particular C. must, like a general C., be established as in force for a time whereof the memory of man runneth not to the contrary. See COMMON LAW. A C. must have been uninterrupted as regards right, though the exercise of it may have been disused; it must have been held without objection, and be unopposed to other customs; it must be not unreasonable nor uncertain in operation.

CU'STOMARY FREE'HOLD, in English Law, a species of estate which, in all practical respects, is identical with Copyhold (q. v.), but in which the tenure is expressed to be according to the custom of the manor, without adding the words 'at the will of the lord.'

CUSTOM HOUSE, the office at a seaport where the custom duties (see next article) are paid, vessels entered and cleared, &c. The several custom houses in the United Kingdom have each a separate establishment of officers, according to the extent of the trade in the port to which it belongs, and the consequent exigencies of the service. The whole are, however, under the control of the Commissioners of Customs. In England, the custom-house officer has the right of personal search only when he has good cause to suspect that contraband goods are concealed about the person.

CUSTOMS DUTIES, the portion of the revenue of the United Kingdom derived from a tax on imports. The origin of the term is connected with the long conflict between the crown and parliament as to the right of taxation. To meet the claims made by the House of Commons of the exclusive right to vote all supplies, it used to be maintained that there were certain duties on exportation and on importation to which the crown had acquired a right by *custom*, and after the power of parliament over this branch of taxation had been fully established, it retained its old name. This tax, after the excise came in force, was always applicable distinctively to goods changing place. There were customs not only upon things leaving and things coming to the British dominions, but also upon commodities transferred from one part to another. In Scot-

land, the duty on commodities imported into any town from a foreign country was called the great custom; and the duty charged by a burghal corporation on commodities coming from the country districts within its walls was called the small or petty customs. At present, the term C. D. applies solely to the tax levied on commodities imported from abroad.

The tax on imports was of old a simple percentage, familiarly known to the readers of English history as 'tonnage and poundage,' from the method in which it was adjusted to heavy and light goods. Subsequently, however, the notion prevailed that the C. D. might not only be a source of revenue, but an instrument for furthering the various theories about protecting this trade and discouraging that, which prevailed from time to time. When it was held as an established principle, with regard to any trade, that the customs should be adjusted in such a manner as either to aid or impede it, the regulations regarding that trade alone would have complexity enough for a whole code of customs laws, the object of which was mere revenue.

The more complex the arrangements, the more open were they to the machinations of the smuggler or defrauder, and consequently regulation had to be added to regulation, till the whole became a chaos. In some instances, the duties were such as to act as a prohibition to importation; in others, merely as a heavy increase on the price. In either case, there would be relaxations in favor of the produce of our own colonies, and perhaps of some favored country with which we had a treaty of reciprocity. Then, to encourage our own trade and manufactures, it was considered politic to allow goods to be imported for exportation abroad, or to be imported for the purpose of being worked up into a manufacture, and there would be a difference between the extent of encouragement granted to that manufacture, if it were for home consumption or for exportation. The method in which such relaxation was accomplished was at first by charging the duty on the importation, and afterwards repaying it by what was called a 'drawback;' and this was subsequently accomplished in an easier method for the importer, by allowing him to 'bond' the goods in the government warehouses until the duty was paid, or the conditions which dispensed with it fulfilled. See WAREHOUSING SYSTEM.

In the year 1825, the laws of the British customs were consolidated into eleven acts of parliament—the fruit of the exertions of the late Mr. Deacon Hume. It will give a conception of the confused and cumbersome condition into which the system had merged, to note that the number of acts repealed on the occasion of the consolidation was 443 and it was afterwards discovered that several had been omitted. There was still a long list of C. D. many of them intended for purposes beyond the mere collection of revenue; but the free-trade legislation of 1846 cleared away a great mass of this burden on the commerce of the country, and almost every year has contributed to the abbreviation of the list of duties or Tariff (q. v.). One by one, articles of solid food have been exempted; and nearly the whole customs revenue is now derived from tea, coffee, dried fruits, spirits, wine, and tobacco. Thus simplified and reduced, the C. D. supply an enormous amount of revenue. The British revenue for the year ending 31st March 1880 was £81,265,055, and to this amount the customs contributed £19,326,000.

The defects which, according to the doctrines now prevalent in this country, are to be avoided in a code of customs, are—1. The prohibition or discouragement of the importation of useful commodities; 2. Encouragement to the smuggler; and 3. Loss of revenue by raising the duty to the height which discourages importation. Under the first head, see ANTI-CORN-LAW LEAGUE, CORN LAWS, and FREE-TRADE. The second is connected with the view that on stimulants the duty cannot be too high, even though it should greatly impede their importation—the duty on tobacco is in some instances, as high as 900 per cent. on the value of the article. But then, if the smuggling trade be encouraged, the stimulant is not only obtained without any contribution to the revenue, but the people become demoralized, and trained to crime.

Under the third head, a memorable example is furnished by the sugar-duties of France, which were so high that the native agriculturists could make sugar from beet-root a little cheaper than the duty-paid foreign sugar. Hence the article was dear, for had it not been for the height of the duty, it would not have been worth while to make it at home, and at the same time there arose little or no revenue from it.

The collection and general management of the C. D. is under one great central department of the government in London. The office of receiver-general was, in 1871, united with that of the comptroller-general, and there is a fourfold division into the paymaster's, examiner's, accountant's, and auditor's branches.

CU'STOS ROTULO'RUM (Lat. keeper of the *rotuli* or rolls), one of the justices of the peace of a county appointed by the crown to keep the county records.

CUSTRI'N. See KUSTRIN.

CUTCH, a protected principality under the presidency of Bombay, stretches along the gulf of its own name and the Indian Ocean between Guzerat and Sinde. It extends in N. lat. from 22° 45′ to 24° 40′, and in E. long. from 68° 26′ to 71° 45′, containing, in something of a triangular form with the maritime line as a base, an area of 15,100 square miles, and a population of rather more than half a million. It is divided naturally into C. Proper and the Runn of Cutch.—1. C. Proper, consisting of 6500 square miles, and numbering nearly all the inhabitants, is the belt on the sea-shore, touching Sinde, of which it may be regarded as a physical continuation, on the north-west, and being separated by a detached portion of the Runn from Guzerat on the south-east. While the southern edge of this belt is merely a sandy desert, the northern section, traversed lengthwise by two parallel ranges of hills, presents, amid much sterility, many fertile tracts, which yield cotton, rice, &c., and feed a large stock of horses, kine, buffaloes, and camels. The grand defect of the country is the scarcity of water. Hence the crops occasionally fail from the scantiness of irrigation; and in the month of March 1861, this region was said to be suffering more severely than almost any other in India from a nearly general famine. Timber is scarce, for the growth in the mountains is chiefly brushwood. Here and there, however, decayed trunks of great size, more particularly on the southern ridge, indicate the former existence of noble forests. The mineral productions are coal, iron, and alum. The traces of volcanic action are numerous. Earthquakes also have recently occurred; one of which, in July 1819, besides shaking every fortification to its foundations, and destroying several hundreds of people, threw up an enormous mound of earth and sand many miles in extent, and simultaneously submerged an adjacent district of corresponding size.

The population of the state was estimated, in 1871, to be 409,522, being about 63 individuals to a square mile. The ruler is styled the Rao; and the feudatory chieftains under him are about 200. —2. Runn of C.—subdivided into two parts, the smaller, of 1600 square miles, on the east, and the larger, of 7000 square miles, on the north—is merely an amphibious desert, being, in a great measure, hard ground during the dry season, and then, in turn, a sort of shallow lake formed by the heavy rains and pent-up tides of the south-west monsoon. It is supposed to have been originally a permanent inlet of the ocean, and to have had its level raised by some such convulsion of nature as that which marked the year 1819. The periodical disappearance of the waters leaves behind it one continuous crust of salt. This dreary waste, however, is not without its elevated spots, the islets, doubtless, of a remoter era. Herds of wild asses and clouds of flies are its only inhabitants, and to cross it by day, except in the rainy season, is almost certain death.

CU'THBERT, ST., OF DURHAM, one of the three great saints of England in the middle ages, the other two being St. Edmund of Edmundsbury, and St. Thomas-à-Becket of Canterbury. St. C. was born about 635. Neither his birthplace nor his parentage has been ascertained; but a legend, which was long generally believed, told that he was born in Ireland, and drew his lineage from one of the petty kings of that country. When the light of record first falls upon him, he is a shepherd boy in the kingdom of Northumbria, which then stretched northwards to the Forth. In 651, while watching his flock by night on the heights of Lauderdale, he believes that he sees the heavens open, and a company of angels descend upon the earth, and again ascend to heaven, carrying with them the soul of St. Aidan, the pious bishop of Lindisfarne, or Holy Island. The vision determines him to become a monk, and in the same year he enters the monastery of Melrose, of which St. Boisil was provost or prior, and St. Eata, abbot. When the latter removed to the newly-founded monastery of Ripon, St. C. accompanied him, and was appointed to the office of superintendent of the guests. In 661, St. Boisil died of the plague, which then ravaged Britain, and St. C. was chosen to succeed him as provost or prior of Melrose. While in this office, he distinguished himself by his assiduity in visiting the neighboring villages, and especially the remoter mountain hamlets, sometimes on horseback, but oftener on foot, and laboring by his teaching and example to reclaim the people from the superstitious or pagan rites into which they had fallen. After a few years spent in this way, he left Melrose for the island monastery of Lindisfarne, of which he became provost or prior, his old master, St. Eata, being abbot.

Longing for an austerer life even than the monastic, he quitted Lindisfarne in 676, to become an anchorite, or solitary recluse, in a hut which he built with his own hands on Farne Island. Here, in 684, he was visted by Ecgfrid, king of Northumbria, Trumuine, ex-bishop of the Picts, and other great men of the north, who came at the request of the synod of Twyford to entreat that he would accept the bishopric of Hexham. He reluctantly complies with their wishes, but his heart is still with his Northumbrian islands. He exchanges the see of Hexham for that of Lindisfarne, and still thirsting after solitude, at the end of two years he resigns his bishopric, and returns to his hut in Farne Island. Here he

died on the 20th of March 687. The anniversary of his death was a great festival in the English Church, which commemorated also the 4th of September, as the anniversary of the day on which his body was translated to Durham. The influence which St. C. exercised upon his age seems to have been due chiefly to his fervent piety and extraordinary asceticism. The gift of a persuasive tongue is ascribed to him, and he would seem to have had skill and prudence in the management of affairs, but nowhere is there any trace of his learning.

The fame of St. C. had been great during his life; it became far greater after his death. Churches were dedicated to him throughout all the wide country between the Trent and Mersey on the south, and the Forth and Clyde on the north. When his tomb was opened at the end of eleven years, it was believed that his body was found incorrupt, and so, for more than 800 years, it was believed still to continue. It remained at Lindisfarne till 875, when the monks, bearing it on their shoulders, fled inland from the fury of the Danes. After many wanderings through the south of Scotland and the north of England, it found a resting-place at Chester-le-Street in 882. It was transferred to Ripon in 995, and in the same year it was removed to Durham. Here, enclosed in a costly shrine, and believed to work daily miracles, it remained till the Reformation, when it was buried under the pavement of the cathedral. The grave was opened in 1827, when a coffin, ascertained to have been made in 1541—when the body was committed to the earth—was found to enclose another, which there was reason to suppose had been made in 1104; and this again enclosed a third, which answered the description of one made in 698, when the saint was raised from his first grave. This innermost case contained, not, indeed, the corruptible body of St. C., but his skeleton, still entire, wrapped in five robes of embroidered silk. Fragments of these, and of the episcopal vestments, together with a comb and other relics, found beside the bones, are to be seen in the cathedral library. The asceticism which distinguished St. C. in life, long lingered round his tomb.

Until the Reformation, no woman was suffered to approach his shrine; the cross of blue marble still remains in the cathedral floor which marked the limits beyond which female footsteps were forbidden to pass, under pain of instant and signal punishment from the offended saint. His wrath, it was believed, was equally prompt to avenge every injury to the honor or possessions of his church. It was told that William the Conqueror, anxious to see the incorrupt body of the saint, ordered the shrine to be broken up; but scarcely had a stroke been struck, when such sickness and terror fell upon the king, that he rushed from the cathedral, and, mounting his horse, never drew bridle till he had crossed the Tees. A cloth, said to have been used by St. C. in celebrating mass, was fashioned into a standard, which was believed to insure victory to the army in whose ranks it was carried. Flodden was only one of many fields in which the defeat of the Scots was ascribed to the banner of St. Cuthbert. It hung beside his shrine until the Reformation, when it is said to have been burnt by Calvin's sister, the wife of the first Protestant dean of the cathedral.

The life of St. C. was twice written by the Venerable Bede—briefly in vigorous hexameters in his *Liber de Miraculis Sancti Cuthberchti Episcopi;* at greater length, in prose, in his *Liber de Vita et Miraculis Sancti Cudbercti Lindisfarnensis Episcopi.* In this latter work, he made use of an earlier life by a monk of Lindisfarne, which is still preserved. Besides these lives—all of which have been printed more than once—and what is told of St. C. in Bede's *Historia Ecclesiastica Gentis Anglorum*, the chief ancient authorities are the *Historia Translationis S. Cuthberti*, published by the Bollandists in the *Acta Sanctorum, mens. Martii*, vol. iii.; the *Libellus de Exordio Dunhelmensis Ecclesiæ* by Symeon of Durham; the *Libellus de Nativitate S. Cuthberti de Historiis Hybernensium excerptus*, and the *Libellus de Admirandis B. Cuthberti Virtutibus*, by Reginald of Durham, both published by the Surtees Society. There are two modern memoirs of St. C.—the late Rev. James Raine's *St. Cuthbert* (Durham, 1828), and the Very Rev. Monsignor C. Eyre's *History of St. Cuthbert* (Lond. 1849).

CUTHBERT, a disciple of the Venerable Bede in the monastery of Jarrow, of which he himself was afterwards abbot, was present at the death of his master in 735, and has left a beautiful and touching relation of the event in a letter to his fellow-disciple, Cuthwine. It has been often printed; the best editions are those in Twysden's *Decem Scriptores* (Lond. 1652), and in Stevenson's edition of Bede's *Historia Ecclesiastica* (Lond. 1838).

CUTHBERT OF CANTERBURY, a native of the kingdom of Mercia, became Bishop of Hereford in 736, and Archbishop of Canterbury in 740. He died in 758. An instructive letter was addressed to him by St. Boniface (or Winfrid) on the ecclesiastical abuses of the age. It has been printed more than once, and will be found in the appendix to the late Professor Hussey's edition of Bede's *Historia Ecclesiastica* (Oxon. 1846).

CUTHBERT'S BEADS, ST. See BEADS.

CU'TICLE. See SKIN.

CU'TLASS is a sword about 3 feet long, broad and straight, with a japanned hilt. Cutlasses are mostly used by sailors in the navy, when boarding and taking possession of the enemy's ships.

CU'TLERY, the general name for all kinds of cutting instruments, such as knives, forks, scissors, razors, &c. The workman who makes these is called a cutler; the sword-maker, a sword-cutter; but the manufacturer of workmen's tools is called a 'tool-maker,' or a '*steel toy-maker*,' not a cutler. In Birmingham, for example, such implements as hammers, chisels, pincers, hatchets, &c., are technically called toys.

Shells, flints and other sharp-edged stones formed the rudest and most ancient cutting instruments, and the earliest traces of human existence upon our island and elsewhere, are associated with stone 'celts' and other weapons and cutting implements. These were followed by bronze weapons and implements, which were in use among the Romans for some purposes up to about the time of the Christian era, bronze surgical instruments having been found at Pompeii. This bronze, like steel, could be made soft for working into shape, and then hardened, but by the opposite means used for hardening and softening of steel, bronze being softened by a sudden cooling from a red heat, and hardened by slow cooling. Some cities in Spain and the north of Italy acquired a high reputation for the manufacture of cutting instruments, more particularly swords, during the middle ages, when the chivalry of the period sought the best equipments. Latterly, all countries have been outstripped by England as regards tastefulness, excellence, and cheapness in cutlery. In this kind of manufacture, the lead is taken by Sheffield, which had gained a name for its *whittles* as early as the reign of Richard I. Why, with their ingenuity, taste, and skill in the arts, neither the French nor Belgians succeed in their C., would be difficult to explain. Certain it is that their C. is comparatively inferior as regards temper and finish, while their apparent incapability of making the delicate hinges and springs of clasp-knives has provoked repeated remark. At the same time it is to be allowed that foreign C. is rapidly improving, particularly in table-knives, on which a few years have made a great difference in France. In the manufacture of American axes, Canada has made most marvelous advances, its produce as respects this article excelling that of England.

Good *table-knives* are made of steel and iron welded together; the tang, which goes into the handle, and the shoulder, are of iron, and the blade of steel. The tang and the shoulder are forged from bar iron, and the blade from shear or cast steel. Knife-blades, razor-blades, and other small articles, are usually forged into their required shape while still attached to the bar, which serves for the workmen to hold them by, and is called the 'porter.' When the bar becomes too short, it is grasped in a pair of tongs held close by a ring which clamps them by sliding up their conical handles. Two men are employed in forging such work, which is said to be 'two-handed.' The principal workman, or 'fireman,' uses a small hammer of 2 to 4 lbs. weight, while the 'hammerman' wields the sledge-hammer, weighing from 10 to 15 lbs. The 'fireman,' who attends the heating as well as the anvil-work, directs the hammerman, whose blows merely follow those of the small directing hammer of the fireman. In *drawing down* or *reducing* a bar both in length and width, the flat face of the hammer is used; but when the length or breadth alone is to be extended only the 'pane' or narrow edge of the hammer. The concavity of razor-blades is made by hammering the blade on a small round-faced anvil; the notch or 'nail-hole' of a penknife is struck by means of a chisel of the required form. Superior work, such as razor-blades, are *smithed* after forging—that is, beaten upon an anvil, to condense the metal as much as possible—and slightly ground or *scorched* on a rough stone, to finish the shaping, and remove the 'scale' or black oxidized surface, which would interfere with the color of the tempering. Common knives are made entirely of iron, and the difference of price arises not merely from the difference of cost of the material, but from the greater facility of working. It should also be understood that, in many articles composed of steel welded to iron, the saving of steel is not the only advantage, for steel being more brittle than wrought iron, it is very desirable, in all articles subject to a transverse breaking strain or to concussion, that every part except the cutting or working edge should be of iron. Thus, a hatchet made entirely of steel would be far less durable than one of iron with a welded steel cutting-edge. A table-knife with a steel tang would be weaker than one with an iron tang. Hammers should only be *faced* with steel, &c.

The great usefulness of steel for all kinds of implements used for cutting or exposed to wearing friction, depends upon its property of acquiring a high degree of hardness when heated and suddenly cooled, and of then being capable of softening again in various degrees by reheating moderately. See TEMPERING METALS.

Table-forks are forged rudely into the shape of the tang and shank, first as though but a single thick prong were required; the

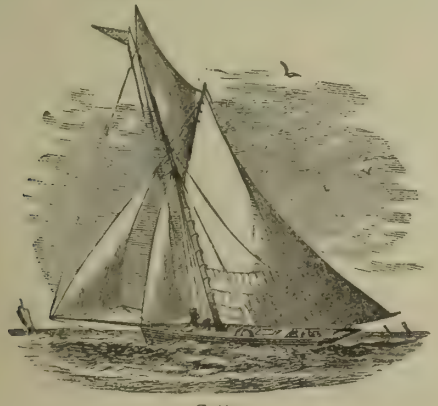
part for the prongs is then beaten out, and a stamping-die is brought down upon it, which forms the prongs, with a thin film of steel between them; this is cut out by a cutting-die. Then they are softened and filed up, again hardened, and tempered, and ground, to smooth and finish. The dry-grinding of forks, needles, &c., is a very deleterious trade, on account of the particles of steel which enter the nostrils of the workmen, and produce most painful irritation, followed by a peculiar disease called 'grinders' asthma,' which is said to shorten life so seriously that few dry-grinders, exposed to the steel dust, reach forty years of age. Many remedies have been proposed for this. A magnetic mouthpiece was invented; but the workmen would not wear it, on account of its novelty, its grotesque appearance, the trouble of cleaning it, and the belief that if their trade were made more healthy, greater numbers would enter it, and wages would be reduced. A revolving fan, which sets in motion a current of air, that is carried by a pipe to the outside of the building, has been used with greater success, and is now in general use when it can be applied, though its introduction was much opposed by the workmen. In the needle-trade especially, it has been most beneficial, entirely removing all danger from the operator. The use of wet stones would, of course, entirely obviate the evil, but they are not applicable to many kinds of work, especially that which is ground before hardening, as the stone wears away very rapidly under these circumstances.

Penknives and other pocket-knives are the work of many hands. Besides the blades, there are the separate pieces of the spring, the handle, rivets, &c., the making of each of which is a distinct trade. All these pieces are finally fitted and put together by the finisher; a good two-bladed knife passes through his hands from 70 to 100 times. The difference in the amount of labor bestowed on the best and the commonest C. is very remarkable, and the difference of price is of course proportionate.

CUTTA'CK ('Royal Residence'), the capital of a district of its own name in the province of Orissa, presidency of Bengal, stands immediately below the bifurcation of the Mahanuddee, thus occupying the apex of the delta of that river. The advantage, however, of this position, in a political and commercial point of view, seems to be in a measure neutralized by the cost of providing against the encroachments of the bordering streams. With a population in 1871 of 50,878, the city has no pretensions to architectural beauty. It has very little trade; and its manufactures are principally shoes and brass cooking-vessels. C. is 220 miles south-west of Calcutta, in lat. 20° 28′ N., and long. 85° 55′ E.

CUTTACK, the district, is in the province of Orissa, on the north-west coast of the Bay of Bengal, and has an area of 3178 square miles, and a pop. (1871) of 1,494,784. The name, however, has been generally used to include the three districts of C., Pooree, and Balasore, with a joint area of 7717 square miles, and a pop. (1871) of 3,034,690. This larger district extends in N. lat. from 90° 40′ to 21° 45′, and in E. long. from 85° 8′ to 87° 31′. The Mahanuddee is the main river, its delta being wholly comprised within the district. Among the natural features of the country, the most remarkable is the Chilka Lake, which is, for many miles, separated from the sea by a strip of sand not more 300 yards wide. Next to Cuttack, the chief towns, reckoning from the south, are Poorree, with its temples of Jaggernaut, at the mouth of the most southerly arm of the Mahanuddee; Kanarak, or the Black Pagoda, about twenty miles further to the north; and Balasore. The trade of the district is inconsiderable. Iron ore is said to be found.

CUTTER is a name given to two kinds of small vessels. The



Cutter.

cutters used by yachtsmen, smugglers, and revenue cruisers, and which are built with especial reference to speed, have a single mast, and a straight running bowsprit that can be run in on board occasionally. They are much like sloops in rig, but have larger sails. Such small vessels occasionally venture on long voyages. In 1857 the *Charter Oak*, a C. of 23 tons, crossed the Atlantic from New York to Liverpool; and, in 1858, the *Christopher Columbus*, a C. of 45 tons, with a crew of only two boys besides the owner, performed the same voyage in 45 days. The cutters belonging to ships of war are clincher-built boats, from about 24 to 28 feet in length, employed for various purposes; they weigh from 10 cwt. to 24 cwt. each. Two such cutters are supplied to every ship of war, except those of the smallest kinds.

CUTTEAMU'NDU, the juice of the *Euphorbia Cuttimundu*, a species of Spurge (q. v.), a native of India, particularly of the Northern Circars. It is used for cementing iron with other substances, as for uniting the blade and handle of a knife. The fresh juice is used as a vesicant. In a dried state, it is capable of being moulded into any form, and a great variety of articles may be made of it, as of gutta-percha.

CUTTINGS are branches or portions of branches of trees or shrubs, employed to produce new plants, by the insertion of the lower end into the earth. By care, and in the most favorable circumstances, almost any tree or shrub may be propagated by C., but some only with great difficulty, and softwooded trees or shrubs most easily. Nothing is more easy than to propagate willows, fuchsias, currants, gooseberries, &c., in this way; but many other plants, commonly propagated by C., require greater attention on the part of the gardener, warmth, a uniform damp atmosphere, and shade. Some kinds of apple are occasionally propagated by C., and in warmer climates than that of Britain, this mode of propagation is found suitable for a greater number of kinds. C. are most advantageously taken from branches of which the wood is young, yet at least a year old. The top is generally cut off, and not much more left above ground than is inserted into it. Care must be taken in planting C., not to use such force as to strip off the bark. Some herbaceous plants are propagated by C., which, in pinks and carnations, are called *pipings*.

CU'TTLE-FISH (*Sepia* and *Sepiadæ*), a genus and family of cephalopodous molluscs of the order *Dibranchiata*. See CEPHALOPODA. The body is oblong and depressed, sac-like, with two narrow lateral fins of similar substance with the mantle. There is an internal shell lodged in a sac on the back part of the mantle, somewhat oval and blade-shaped, being comparatively thick near the anterior end, where it is terminated by a sharp point affixed, as it were, to its general outline; the whole shell is light and porous; it is formed of thin plates with intervening spaces divided by innumerable partitions; and consists chiefly of carbonate of lime with a little gelatinous and other animal matter, which is most abundant in the *phragmocone*, or internal harder part of the shell, where also the laminæ and partitions are closer than in the outer part. The eyes are very large, and the head is furnished with eight arms, each of which has four rows of suckers, and two long tentacles expanded and furnished with suckers on one side at the extremity. The COMMON C. (*Sepia officinalis*) is abundant on the British coasts. Its skin is smooth, whitish, and dotted with red. It attains the length of a foot or more. It is one of the pests of fishermen; often, along with calamaries, partially devouring the fish which have been caught in their nets.

Cuttle-fish.

In Scotland, the fishermen call it the O fish. It is not itself easily caught, being very active in making its escape by swimming, and also promptly throwing out its ink to darken the water around it. It is sometimes cast upon the shore, but far more frequently its bone, which is used for making pounce, tooth-powder, &c., for forming moulds for small silver castings, for polishing, and for other purposes in the arts; and was formerly often used

Cuttle-fish Bone.

in medicine as a corrective of acidity in the stomach, for which purpose, however, it is no better adapted than any other form of carbonate of lime. The ink of the C. furnishes the valuable pigment called *Sepia* (q. v.), which is said by some chemists to contain a peculiar animal principle called *Melanine* (Gr. *melas*, black), and is wonderfully indestructible. Dr. Buckland indeed found the pigment remaining in fossil molluscs akin to the C. to be fit for use, and to make excellent sepia, notwithstanding all the unreckoned ages that had elapsed from the time of its secretion by the living organisms.—The eggs of the C. are not unfrequently cast ashore, clustered together like grapes, and are known to the frequenters of the coast as *Sea-grapes*. The flesh of the C. was

esteemed by the ancients. A receipt for making a C. sausage will be found in Athenæus.—Numerous species of C. inhabit different seas.

CUVIER, Georges Chretien Leopold Dagobert, Baron, was born August 23, 1769, at Montbéliard, in the department of Doubs, a town which then belonged to Würtemberg. His father was an officer in a Swiss regiment. Having made rapid progress in learning at the Montbéliard gymnasium, C. entered, in 1784, the Karlsakademie at Stuttgart. Here, in the midst of various studies, he retained that predilection for natural history which he had displayed when only twelve years old. The restricted means of his parents, however, compelled him, in 1788, to take a situation as private tutor in the family of Comte d'Héricy, who resided near Fécamp, in Normandy. Here C. lived for six years, quietly but ceaselessly pursuing his studies in natural history. An acquaintance accidentally formed between him and the Abbé Tessier (noted as a writer on agriculture), was the cause of C.'s obtaining an introduction to Geoffroy St. Hiliare and other eminent Parisian savans. Startled by the novelty and comprehensiveness of his views on zoology, Geoffroy St. Hilaire urged him to come to Paris, which he did, and, in 1795, was appointed professor in the Ecole Centrale of the Panthéon.

Soon after this appointment, C. was made assistant to Mertrud, the teacher in comparative anatomy at the Jardin des Plantes, and now he began to form that collection in natural history which ultimately became the largest in Europe. In 1796, he was made a member of the National Institute; in 1800, he succeeded Daubenton in the Collége de France; and, in 1802, was made perpetual Secretary of the Institute. He gradually rose in the estimation of the Emperor, and in 1808, was commissioned to superintend the institution of academies in the new territories attached to France. Shortly before the fall of Napoleon, C. was admitted into the Council of State. The Restoration did not deprive him of his honors, but added to them; he was made Chancellor of the University of Paris, and, henceforward, received from time to time new rewards for his services to science. After a visit to England (1818), where he was received with great honors, he was, in 1819, admitted into the cabinet by Louis XVIII., and, in 1826, was made Grand Officer of the Legion of Honor; but his decided opposition to the royal measures for restricting the freedom of the press, lost him the favor of Charles X. Uuder Louis Philippe, he was made a peer of France in 1831, and in the following year was nominated Minister of the Interior, when he was suddenly attacked with paralysis, of which he died, May 13, 1832.

It is difficult, in our narrow compass, to give a summary of the merits of C., so various were his attainments, so great was his success in so many departments. He laid the foundation of the now universally recognized method of classification in Zoology (q. v.), and raised comparative anatomy (which until his time had been merely a heap of unconnected details) to the dignity of a science. After a long series of patient observations on numerous animals, especially the hitherto little-known order of mollusca, he published (1801—1805) his *Leçons d'Anatomie Comparée*, which was completed by the *Mémoire pour servir à l'Histoire de l'Anatomie des Mollusques* (1816). With admirable sagacity, he applied the principles of his Comparative Osteology to the remains of fossil vertebrate animals, and thus opened a field of investigation in which numerous explorers have since successfully labored. His *Recherches sur les Ossements Fossiles des Quadrupèdes* (1821—1824) is a mine of information in natural history, and affords the strongest arguments in favor of the theory of a progressive series of animals, advancing from the most simple to the most complex forms of organization.

C.'s rare faculty of expressing scientific truths in a popular and elegant style, was displayed in his celebrated *Discours sur les Révolutions de la Surface du Globe et sur les Changements qu'elles ont produits dans le Règne Animal* (latest edition, Paris, 1851). This discourse was published as an introduction to the above-named *Recherches sur les Ossements Fossiles*. In concert with Valenciennes, C., in 1828, commenced a *Natural History of Fishes*, which was founded on the largest ichthyological collection ever made by an individual. It was continued by Valenciennes. Lastly, we may notice the éloges delivered by C. (and published in the *Recueil d'Eloges Historiques*, 1839), as valuable contributions to the history of science.

In public life, C. was as remarkable for activity as in the quiet work of the study. He never blindly surrendered himself to any party, but at all times gave proof of an honest, sagacious, and resolute character. In his plans for the extension and improvement of national education, he was zealous and indefatigable, as also in his efforts for the welfare of the Protestant Church in France, of which he was a member.—Mrs. R. Lee's *Memoirs of Baron C.*(Lond. 1833); Pasquier's *Eloge de C.* (Paris, 1833).

CUXHA'VEN, a town of Germany, situated on the left or southern bank of the Elbe, just where it is lost in the German Ocean. It is about 60 miles distant from Hamburg, to which free city it belongs. C. is a small place, but of importance as the port from whence the Hamburg steamers ply when in winter the Elbe is frozen over. The harbor affords good shelter, and is much resorted to by vessels waiting for favorable winds. Pilots for the Elbe are taken in here. Pop. (1880) 2200.

CUYA'BA, capital of Matto Grosso, the second largest and most westerly province of Brazil, occupies pretty nearly the center of South America, being in lat. 15° 36′ S., and long. 55° W. It stands on the left bank of a river of the same name, and is estimated to contain about 10,000 inhabitants. Its mines, which have yielded gold and diamonds since 1719, are now nearly abandoned, the cost of working them being unremunerative. C. sends to Rio, the principal seaport of the country, large quantities of hides and ipecacuanha by caravans of 200 or 300 mules each. The chief edifices of the city are its three churches, an hospital, a school of philosophy, and the public buildings of the province.

CUYP, or KUYP, Jacob Gerritse, commonly called the Old C., was born at Dordrecht in 1575. Jacob C.'s representation of cows and sheep, battles and encampments, are clever, but his fame rests principally upon his excellent portraits. His coloring is warm and transparent; his manner, free and spirited. C. died in 1650.—Aelbert Cuyp, Jacob's son, was born at Dordrecht, in 1605.

He excelled in the painting of cattle grazing or reposing, moonlights, wintry landscapes, still waters with ships, horse-markets, hunts, camps, and cavalry-fights. During his lifetime and long after, Aelbert's pictures, although in many respects equal to those of Claude, were held in little estimation. Opinion, however, has now changed regarding them. One of his still waters, which was sold in 1777 for 416 guilders (£34 13*s*. 4*d*.) brought 12,720 guilders (£1060) in 1844. England is particularly rich in his works. He died at Dordrecht, 1691.—Benjamin Cuyp, a nephew of Aelbert, lived at Dordrecht, and painted biblical pieces in Rembrandt's style, and familiar scenes of country-life. His best works are in the manner of Teniers. His sea-shores have less repute. The dates of his birth and death are unknown, but, from the multitude of his pictures, it is conjectured that he lived to a great age.

CU'ZCO, the name of a city, a province, and a department in Peru. 1. C., the city, was originally the capital of the Incas (in the language of the Incas, says Garcilasso, C. signifies 'naval') and the center of the empire, which, besides the territory of the existing republic, comprised Bolivia, most of Ecuador, and portions also of Chili and the Argentine Confederation; and is still, next to Lima, the most populous city in the state, containing fully 47,500 inhabitants. It stands on the Guatanai, one of the remotest headwaters of the Amazon, in lat. 13° 31′ S., and long. 72° 2′ W., at the eastern end of that section of the Andes known as the Knot of Cuzco, 11,000 ft. above sea-level. Notwithstanding its aboriginal name, C., with the exception of some neighboring ruins, part of which, perhaps, carry one back beyond the era of the Incas, is really of Spanish origin, being built in the form of a square, and presenting many handsome edifices. It is about 200 miles to the north-north-east of Arequipa, having its maritime outlet in Islay, the port of that city. The manufactures of the place are cottons, woollens, embroidery, and jewelry.—2. The province, otherwise styled the Cereado, embraces nothing beyond the city itself but the suburb of San Jeronimo.—3. The department subdivided into 11 provinces, lies wholly in the sierra or Andine region of the country, having the coast on the west, and the montana, or Transandine territory, on the east. It numbered in 1871, 464,000 inhabitants, being considerably more populous than any other department. It stretches in S. lat. from 13° to 15°, and in W. long. from 70° to 73°, with an area of about 45,000 square miles. In addition to C. itself, it has the towns of Abancay and Urubania.

CY'AMUS BALÆNA'RUM. See Whale Louse.

CYA'NIC ACID is a compound of cyanogen (q. v.) and oxygen along with water, and is represented by the symbol C_2NO,HO, or CyO,HO.

CY'ANITE, KYANITE (Gr. *kyanos*, blue), DISTHENE, or SAPPARE, a mineral composed of alumina and silica. It often occurs crystallized, and generally in broad prisms. It is sometimes colorless, red, yellow, &c., but frequently of a fine sky-blue, slightly tinged with violet; it is transparent, and sometimes beautifully opalescent. It occurs chiefly in mica-slate, talc-slate, and granite; is found in different parts of Europe, Asia, and America, and in several places in Scotland. It is sometimes used as a gem.

CYA'NOGEN (C_2N or Cy) is a compound organic salt radical, which is mainly interesting as being the principal component of hydrocyanic or prussic acid. It is most easily prepared by heating the cyanide of mercury (HgCy) or the cyanide of silver (AgCy) in a tube, when the C. is evolved as a gas at ordinary temperatures, but can be condensed by cold and pressure into a thin, colorless liquid, which freezes at —30° F. Gaseous C. has a specific gravity of 1806 (air = 1000), is inflammable, and burns in air or in oxygen

with a characteristic purple or rose tint; is soluble in water to the extent of 4 to 5 volumes of the gas in 1 of water. It combines with metals, such as potassium, to form a class of important cyanides, as the cyanide of potassium. See POTASSIUM, HYDROCYANIC ACID, &c.

CYANOHY'DRIC ACID. See HYDROCYANIC ACID.

CYANO'SIS (Gr. *kyanos*, blue), lividity of complexion, with fulness of the capillaries and minute veins, especially of the face and lips. A name characteristically applied to the color in certain cases of congenital disease or malformation of the heart. See HEART, DISEASE AND MALFORMATION OF.

CYA'NOTYPE PRO'CESSES, in Photography, are those in which the compound radical cyanogen is employed; they were discovered by Sir John Herschel, and depend for their successful practice on the reduction of a persalt of iron to the state of protosalt, by the action of light, in the presence of organic matter.

Good paper is immersed in a solution of ammonio-citrate of iron of the strength of 40 grains to 1 ounce of water; it is then dried, and exposed—at any convenient time during a fortnight—under a negative, when a picture of a pale brown tint becomes faintly visible upon a yellow ground; it is then brushed over with a solution of ferrocyanide of potassium (yellow prussiate of potash), which develops the picture of a deep blue tint; and this may be further deepened by immersion in a solution of carbonate of soda, which has the effect, at the same time, of removing the unaltered ammonio-citrate, and permanently fixing the picture. Similar results may be obtained by employing ferridcyanide of potassium (red prussiate of potash), or a mixture of the ferridcyanide and ammonio-citrate, in which latter case the paper is sensitive as soon as treated with the mixed solutions, and must therefore be dried in the dark. To fix the picture, it is only necessary to wash with water. A subsequent treatment with a weak solution of protonitrate of mercury, has the effect of apparently removing the whole of the picture. If the mercury salt, however, be perfectly washed away, and the picture dried, and ironed with a very hot iron, it is speedily reproduced in all its vigor.

CYANU'RIC ACID is an organic acid allied to cyanic acid, and having the formula $C_6N_3O_3,3HO$, or $Cy_3O_3,3HO$, it is obtained by heating urea to expel ammonia, or by the destructive distillation of uric acid.

CYA'THEA, a genus of ferns (q. v.), of the sub-order *Polypodiceæ*, containing many species, natives of tropical and subtropical regions, both of the Old and of the New World. They are tree-ferns, and some of them have lofty stems and gigantic fronds; they are generally also characterized by great gracefulness and beauty. *C. arborea*, sometimes designated the Common Tree-fern, is a native of the West Indies, Brazil, &c. The fronds are bipinnate, the pinnules deeply pinnatifid. The roots of *C. medullaris*, a species found in New Zealand, contain much starch, and are baked and used as food.

CYATHOPHY'LLUM, a genus of fossil stony corals, with a simple or branched polyparium, internally lamellated, the lamella having a quadripartite arrangement. The older portions are cut off by transverse 'tables' or septa, and the base of the stem is often supported by root-like processes. This genus was especially abundant in the Devonian measures, 36 species having been described from them. It made its first appearance in the Silurian seas, and perished at the close of the carboniferous epoch.

CY'BELE. See VESTA.

CY'BIUM, a genus of fishes of the family *Scomberidæ* (q. v.), having a long fine dorsal, detached finlets, an elongated body, a keeled tail, no pectoral cuirass, and no armature on the lateral line, compressed trenchant teeth in the jaws, and very numerous villiform teeth in other parts of the mouth. A number of species are natives of the seas of the East Indies, some of which are much esteemed for the table; and one species, *C. Commersoni*, is used in a dried as well as in a fresh state; and in a dried state is, to some extent, an article of commerce in India.

CYCADA'CEÆ, or CYCA'DEÆ, a natural order of exogenous plants, consisting of small trees and shrubs, somewhat resembling palms in their general appearance, but much more nearly allied to *Coniferæ* (pines, firs, &c.) in their botanical characters; C. being one of the few orders placed by Lindlay along with *Coniferæ* in his class of *Gymnogens* (q. v.).

The stems are generally simple, and either cylindrical or short and spheroidal; sometimes they are branched by successive forkings; they are much marked with scars of leaf-stalks; they consist internally of a mass of pith traversed by woody bundles, and rings of woody matter. The leaves are large and pinnated, and unfold by unrolling, like the fronds of ferns. This curious and beautiful order contains about fifty known species, natives of tropical and sub-tropical countries. None are found in Europe. They all have a mucilaginous nauseous juice, but with this there is often much starch, which being separated, forms a wholesome article of food. A kind of sago is made in Japan from the cellular substance which occupies the interior of the stem of *Cycas revoluta*, in the Eastern Peninsula from *C. pectinata*, and in the Moluccas from *C. circinalis*. From these species, which are trees 30—40 feet high, there exudes a transparent gum, resembling tragacanth in its properties. Their nuts are also eaten, after being fermented and roasted. The large seeds of *Dion edule* afford a kind of Arrow-root in Mexico; and a starchy substance, sometimes called Arrow-root, and sometimes Sago, is obtained from *Zamia pumila* and other dwarf species in the West Indies. Caffer bread (q. v.) belongs to this order.—Fossil C. are numerous, and occur in some of the oolitic and other strata in England.

CY'CHLA, a genus of fishes of the family *Chromidæ* (included by Cuvier in the *Labridæ*, or Wrasse family), of which many species occur in the rivers of tropical America. They have small and crowded teeth, forming a large band. Some of them are reckoned among the finest fishes for the table in Brazil and Guiana. They are also remarkable for the beauty and brilliancy of their colors. Some of them are large, and some small. Allied to this genus is *Chromis*, of which one species, *C. Niloticus*, the Egyptian *Corycina* of the ancients, inhabits the Nile, and is reckoned the best fish in Egypt. It attains the length of two feet.

Cyclamen Europæum.
a, the whole plant; *b*, the fruit.

CY'CLADES. See ARCHIPELAGO and GREECE.

CYCLA'MEN, a genus of plants of the natural order *Primulaceæ*, having a wheel-shaped corolla, with a long reflexed limb, and flower-stalks twisted spirally downwards after flowering. The species are herbaceous perennials, not numerous, and chiefly natives of the south of Europe.

They have turnip-like, partly subterranean stems, which are very acrid, but nevertheless are greedily eaten by swine, and the plants are accordingly often designated SOWBREAD. They are drastic and emmenagogue. A very stimulant ointment is prepared from them, which externally applied by friction, expels intestinal worms from children. Several of the species are frequent in our flower-gardens, on account of the beauty and fragrance of their flowers, which have the additional charm of being produced early in spring. One species only, *C. hederæfolium*, has a very doubtful claim to a place in the flora of Britain.—The active properties of the species of C. have recently been found to depend upon a peculiar principle called *Cyclamine*, which produces effects on the animal system similar to those of Curari (q. v.).

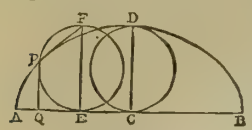
CY'CLE (Gr.), which means simply circle, is a term used in Chronology to denote an interval of time in which certain phenomena always recur in the same order. Cycles have chiefly arisen from the periods of revolution of the earth and other celestial bodies not being commensurable. One unit of time is the day of 24 hours, being the period of revolution of the earth round its axis. But neither the year—the period of the earth round the sun—nor the month—the period of the moon round the earth—can be measured by days, or even by hours, so exactly as not to leave fractions. Cycles have been invented to swallow up these fractions of time in whole numbers expressing days, in such a way that after a certain number of revolutions of the body whose period has been put against that of the earth on her axis, the body shall at last occupy the same place in the heavens and calendar as it did when the C. commenced. Of the numerous cycles or periods of this kind that have been invented, the more important are noticed under their specific names. See INDICTION, METONIC CYCLE, PERIOD, GOLDEN NUMBER, &c.

CYCLOBRANCHIA'TA (Gr. circle-gilled), an order of gasteropodous molluscs, in which the gills usually form a series of lamellæ, surrounding the body between the foot and the mantle. To this order belong the univalve *Patellidæ*, or Limpets, and the multivalve *Chitonidæ*, or Chitons.

CY'CLOID (Gr. circle-like). If a circle roll along a straight line on its own plane, a point on the circumference describes a curve which is called a cycloid. The curve is one of the most interesting we know in respect both of its geometrical properties and connection with dynamics. One of its most interesting properties is this: The time of a body's descending from rest from any point in the arc of an inverted C. to the lowest point is the

same, from whatever point of the curve the body begins to descend. This is sometimes expressed by saying that C. is the *isochronous* (Gr. equal-time) *curve*.

The body having reached the lowest point, will, through the impetus received in the fall, ascend the opposite branch of the curve to a height equal to that from which it fell, losing velocity in its ascent by the same degrees as those by which it acquired it in its descent, and it will employ precisely the same time in ascending as it did in descending. It is clear that if a surface could be procured that would be perfectly smooth and hard, the C. would thus present a solution of the perpetual motion. The curve was discovered by Galileo in 1615. The line AB, which is called the base of the cycloid, is equal to the circumference of the generating circle; and CD, which is the axis of the cycloid, is equal to the diameter. In any position EPF of the generating circle, AE is equal to the arc EP; AQ, the abscis, = AE — QE = arc EP — sine of EP; and PQ, the ordinate, = 1 — cosine of EP.



The Cycloid.

CYCLOID FISHES, an order of fishes, according to the classification proposed by Agassiz, having *cycloid* scales (Gr. *kyclos*, a circle)—scales formed of concentric layers, not covered with enamel, and not spinous on the margins. Cycloid scales are generally imbricated, but are sometimes placed side by side without overlapping. Very many of the existing fishes are of the cycloid order, and fossil C. F. are numerous in the more recent strata from the chalk upwards, but they first appear in the chalk.

CYCLONES. See STORMS.

CYCLO'PEAN ARCHITECTURE, or MASONRY, the name which has come to be generally used for a wall of large irregular stones, unhewn and uncemented. The term originated in Greece, where structures of this kind were fabled to have been the work of the Cyclopes, or one-eyed giants. The walls of Tiryns, near Nauplia—alluded to by Homer—are an example of the ruder style of Cyclopean masonry. They are of irregular unshapen stones, from 6 to 9 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep; the interstices are filled up by small stones, but no mortar is used. The walls of Mycenæ and of Epirus are examples of more advanced C. A.: here, the blocks, although irregular in size and shape, are fitted carefully to each other, showing close joints and a smooth surface. These structures are now commonly believed to have been reared by the Pelasgians (q. v.), probably more than a thousand years before the Christian era. They are found not only in Greece, but in Italy and Asia Minor.

The next stage of Cyclopean masonry shows an approach to horizontal courses, as in the walls of several towns in Greece, and of some in Etruria. Lastly, the name of Cyclopean work is applied, but not perhaps quite accurately, to a kind of masonry which obtained among the Etruscans (q. v.), where the blocks are both squared and laid in horizontal courses, but not cemented. In some cases—as in the walls of Cosa, in Tuscany, believed to have been first a Pelasgian, and then an Etruscan city—the lower part is of irregular polygonal blocks, the upper part of squared stones in horizontal courses. In at least one instance—a wall in the Peloponnesus—a foundation of excellent ashlar is surmounted by irregular polygonal blocks of the usual Cyclopean type.

Masonry, partaking more or less fully of the Cyclopean character, is to be found in Persepolis, and elsewhere in Asia, in several parts of Western Europe, and in some parts of America. The walls of Cuzco, and the ruins of what is called the house of Manco Capac, on an island in the lake of Titicaca, in Peru, are interesting examples of the C. A. of the New World. Instances of Cyclopean work on a smaller scale are to be found in the British Islands, in the walls of the primitive 'duns' or hill-forts, or in the 'cashels' or precincts of early religious houses. Among Irish examples may be mentioned the Grianan of Ailech, in the county of Donegal; Staigue Fort, in the county of Kerry; Dun Ængus, on one of the Isles of Arran, on the west coast of Galway; the Giant's Scone, near Coleraine; and the Rock of Cashel. Among Scotch instances may be named the Laws, in the parish of Monifieth, not far from Dundee, and the ruins on St. Columkille's Island, near Migsted, in Skye. In the Bibliothèque Mazarine at Paris, there is an interesting set of models of the Cyclopean buildings of Greece and Italy, by M. Petit-Radel, the author of *Recherches sur les Monumens Cyclopéens*.

CYCLOPE'DIA. See ENCYCLOPÆDIA.

CYCLO'PÉS (Gr. *kuklopes*, 'the round-eyed'), in Greek mythology, are of three kinds. 1. The Homeric C., a wild, lawless, gigantic race inhabiting the sea coasts of Sicily, the most prominent of whom is Polyphemus (q. v.). Although Homer does not directly call them one-eyed, yet he expressly terms Polyphemus such, andthe later poets attribute his peculiarity to the rest. 2. The three C. mentioned by Hesiod, Brontes, Stereopes, and Arges, each having one eye in the middle of his forehead; these were sons of Uranus and Gæa, belonged to the race of Titans, and forged thunderbolts for Zeus.

Hurled into Tartarus by their father, but delivered by their mother, they helped Kronos to usurp the government of heaven. Kronos, however, in his turn, threw them back to Tartarus, from which they were again released by Zeus, whose servants they now became. Finally, they were slain by Apollo, because they forged the thunderbolt with which Zeus killed Asclepius. Later tradition placed their workshop in Mount Etna, or in the volcanoes of Lemnos and Lipari, and made them the slaves of Hephæstus. 3. The C. mentioned by Strabo, as a people who had come from Thrace or Lycia to Argolis, and were distinguished for their skill as builders. Their constructions are known as the Cyclopean walls, and many of them still exist in parts of Greece and Italy. The statement of Strabo is quite untrustworthy. More probably the so-called Cyclopean walls were built by some ancient race, perhaps the Pelasgians (q. v.), at a period long anterior to the historical civilizations of Greece and Rome.

CY'CLOPS, a genus of minute entomostracous crustaceans of the order *Branchiopoda* (q. v.), having a soft and rather gelatinous body divided into two portions, one consisting of the head and thorax, the other forming the tail. There is only one eye, situated in the middle of the forehead, and generally of a bright crimson color, sparkling like a gem when the animal is viewed through a microscope. The species of C. are numerous; they inhabit both the sea and fresh waters, generally residing among or upon aquatic plants. They are extremely active, and dart about with great rapidity.

CYCLO'PTERUS. See LUMPSUCKER and SUCKING FISH.

CYCLORA'MA, a series of views, which, being wound round cylinders, are made to pass in consecutive order before the spectator, so as to produce the effect of motion on his part, as the banks of a river are seen from a steamboat, or the country from a railway.

CYCLO'SIS (Gr. circulation), the name employed to designate certain still very imperfectly understood movements of the contents of cells in plants. As they have been observed in plants of the most different natural orders, it is not unreasonably presumed that they prevail throughout the whole vegetable kingdom.

CYCLOSTOMATA, a division of the Vertebrates, including the Lamprey (q. v.). See also CARTILAGINOUS FISHES, and the table in ZOOLOGY.

CYDO'NIA. See QUINCE.

CY'GNET, a young swan.—CYGNET-ROYAL, in Heraldry, a swan gorged with a ducal coronet, having a chain thereunto affixed, and reflexed over its back.

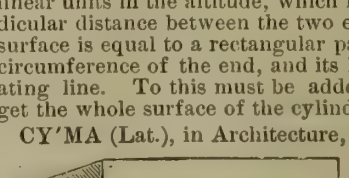
CY'GNUS. See SWAN.

CYGNUS (Lat. the Swan), a constellation in the northern hemisphere, between Lyra and Cassiopeia. See STARS.

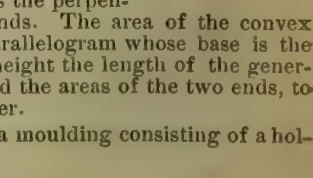
CY'LINDER (Gr. *kylindo*, to roll) is the name of a genus of geometrical solid figures, of which there may be endless species. The most common kind of C. is that which is generated by the revolution of a rectangular parallelogram about one of its sides, which line is called the axis of the cylinder. But in order to embrace all varieties of cylinders, we must generalize the mode of generation. A C., then, is a solid generated by a line which moves parallel to itself while one end traces upon a plane any curve whatever. When the position of the generating line is at right angles to the plane, the C. is *right;* when not, it is *oblique*. If the curve traced is a circle, and the line perpendicular to the plane, the C. is a *right circular C.*, &c. In all cases the content of the C. is found by multiplying the number of square units in the base by the number of linear units in the altitude, which is the perpendicular distance between the two ends. The area of the convex surface is equal to a rectangular parallelogram whose base is the circumference of the end, and its height the length of the generating line. To this must be added the areas of the two ends, to get the whole surface of the cylinder.

Right Circular Cylinder.

CY'MA (Lat.), in Architecture, a moulding consisting of a hollow and round conjoined. When hollow in the upper part, it is



Cyma Recta.



Cyma Reversa.

termed C. recta; when hollow in the lower part, it was called C. reversa.

CYMA'TIUM. See ENTABLATURE.

CY'MBALS are military instruments of percussion, which, when struck one against the other, produce a loud harsh sound of no fixed pitch. The best C. are those made in Turkey and in China. Attempts to discover and imitate the composition of the metal have all failed. The notes in music for this instrument are all placed on the same line or space, in rhythmical succession. C., although military instruments, are now much used in the orchestra by modern composers.

CY'MBEL, an organ stop of the mixture species, consisting of three ranks of pipes. Also a stop found in very old continental organs, consisting of a machine like a star placed high up on the front of the organ, on which were hung small bells, which sounded when the star was moved round on its center by a current of air from the organ.

CY'ME, in Botany, a common form of Centrifugal (q. v.) inflorescence, in which the rachis or floral axis disappears by separating into irregular branches, and these are short and corymbose. It is of very general occurrence in the *Caryophyllaceæ*. Examples may be seen also in the common elder, different species of *Viburnum*, &c. The *verticillasters* of the *Labiatæ* are small cymes in the axils of opposite leaves, assuming nearly the appearance of whorls.

Example of a Cyme.

CY'MRY. See CELTIC NATIONS.

CYNA'NCHÉ (Gr. *kuon*, a dog, and *ancho*, I suffocate), a term applied to the severer forms of sore throat. See THROAT, AFFECTIONS OF THE.

CYNA'NCHUM, a genus of plants of the natural order *Asclepiadaceæ*, having a wheel-shaped corolla, and a lobed or cleft corona. *C. Monspeliacum*—a herbaceous twining plant, with roundish, heart-shaped, stalked leaves, a native of the shores of the Mediterranean—yields the drug called *Montpellier Scammony*, a violent purgative, and not much used. *C. ovalifolium* is a native of Penang, and its sap yields caoutchouc of excellent quality.

CYNAROCE'PHALÆ. See COMPOSITÆ.

CY'NICS, the name applied to a sect of Greek philosophers, who were distinguished mainly for their morose and snarling ethics. For a knowledge of their peculiar opinions, see articles ANTISTHENES, DIOGENES, MENIPPUS, &c.

CY'NIPS. See GALL-FLY.

CY'NODON, a genus of grasses, having digitate or racemose, spikes, with spikelets on one side, glumes nearly equal, boat-shaped, and containing one floret, which has two awnless paleæ, the fruit coated with the hardened paleæ. The most important species is *C. dactylon*, a grass very widely diffused, being the principal fodder grass and best pasture grass of India, where it is the principal covering of many thousands of square miles, and is known by the names of *Dhob*, *Doorba*, &c., and also common in the south of Europe. In Britain, it is rare, being found only on the sandy shores of Cornwall. Its creeping roots, and those of its congener, *C. lineare*, have medicinal virtues, and are sometimes used as a substitute for sarsaparilla.

CYNOMO'RIUM, a genus of plants of the curious parasitic natural order *Rhizantheæ* (q. v.). *C. coccineum*, a plant of a strange fungus-like appearance, is found in the islands of Malta and Gozo, most abundantly on a particular rock in Gozo. It was long known as *Fungus Melitensis*, and enjoyed the highest reputation as a styptic, besides being used as an astringent in dysentery and other maladies. So high a value was set upon this plant, that the knights of Malta took it under their particular care as one of their choicest possessions; it was carefully gathered and deposited in a government office, from which the grand-master sent it to friendly sovereigns, and to the hospitals of the island. A keeper of the rock which produces the plant is still appointed, and his salary appears in the public accounts of Malta.

CY'NOSURE, (Gr. *kynosoura*, the tail of the dog; *Ursa Minor*, the Little Bear) is the constellation of which the pole star is the principal star. Milton's lines—

> Where perhaps some beauty lies.
> The Cynosure of neighboring eyes.—*Allegro.*—

have made the word popular; the metaphor is grounded on *Ursa Minor* being the constellation towards which the others look, as it were, and round which they wheel.

CYNOSU'RUS. See DOG'S-TAIL GRASS.

CYPERA'CEÆ, or CARICI'NEÆ, sometimes popularly called SEDGES, a natural order of plants, akin to Grasses, but having generally a triangular stem, which is without joints, or almost so, and often leafless. The leaves are sometimes sheathing, but their sheaths are always entire, not split, as in the grasses. The flowers, which are hermaphrodite in some, and unisexual in others, consist of a scale-like *glume*, under which lie the organs of fructification, the pistils alone being frequently enclosed in a separate urn-shaped covering; the place of the perianth is sometimes supplied by a few bristles.

The stamens are 1—12 in number, the anthers erect: the ovary is one-seeded, the style single, trifid or bifid; the fruit a small crustaceous or bony nut, the embryo lenticular, and enclosed within the base of the albumen. Plants of this order, which contains fully 2000 known species, occur in all zones; some of the genera, as *Carex* (q. v.), abounding in the colder, some, as *Cyperus* (q. v.), in the warmer parts of the world. Many of them are plants of very humble growth, some, as Bulrushes, Papyrus, &c., comparatively large, but none rival in size the bamboos and other gigantic grasses. Most of them grow in marshy and moist places, but a few in sunny dry places. Their stems and leaves are in general very deficient in succulence, and in most of them, also very rough, so that they are eaten by domesticated cattle only when in a very young state, and rather from necessity than from choice, and are regarded by farmers as mere weeds. See CAREX, CYPERUS, and SCIRPUS. Some of the uses of plants of this order are noticed in the articles BULRUSH, COTTON-GRASS, and PAPYRUS.

CYPE'RUS, a genus of plants of the natural order *Cyperaceæ*, distinguished by hermaphrodite flowers and compound spikelets of numerous two-rowed glumes including no bristles or scales. It contains a great number of species, chiefly tropical, and gradually decreasing in number towards the colder parts of the globe. Only two are found in England, and these are very rare. Many of the species have tubers or corms, which in some are mucilaginous and nutritious; in others, contain also a bitter principle, and possess medicinal qualities. Of the latter class is *C. longus*, or Sweet C., one of the species which have been found in England, common in ditches and wet meadows in some parts of Europe, the rhizome of which has an odor of violets, and is astringent, tonic, and stomachic. It has been employed in medicine from very ancient times; but is now more used in perfumery. Some of the Indian species are also used medicinally and in perfumery in their native country, as well as species of kindred genera. Of those with esculent tubers, the most important is *C. esculentus*, sometimes called Rush-nut, a native of the south of Europe and north of Africa, which is cultivated to a considerable extent in Egypt, Italy, Spain, Portugal, and the south of France. The root of this plant throws out creeping branches, at the end of which form farinaceous tubers of the size of a hazel-nut, which are called Earth Almonds (*Amande de terre*) by the French. They have a sweetish taste, and are used like almonds for the dessert, and also for making *Orgeat* (q. v.).

Cyperus Esculentus: *a*, whole plant; *b*, cluster of spikelets; *c*, a single flower.

They are said to possess not only nutritive, but restorative and stimulant properties. Of late, they have become a considerable article of commerce, upon account of the bland fixed oil which they yield, and are chiefly exported from Spain and Portugal to Holland. They contain about 16 per cent. of oil. The roots of this plant and its allies are the only roots known to contain much oil. The tubers of *C. bulbosus* or *Jemenicus* are eaten in India, either roasted or boiled, or are dried in the sun and made into bread; but their small size makes them troublesome of collection and preparation. Those of *C. geminatus* are also eaten. The tubers of some species of Sirpus (q. v.) resemble in quality those of the esculent species of cyperus. The fibre of *C. textilis* is so strong that it is employed in India for making mats.

CYPRÆ'A. See COWRY.

CY PRÈS, doctrine of, in English law. As the law forbids the giving of an estate tail to the son of an unborn son of a living person, after a life-estate given to such unborn son, and would re-

gard such estate tail as void, the courts, when such a gift is made in a will, apply the doctrine of C. P., and endeavor, *as near as possible*, to carry out the testator's wish, by giving to the unborn son of the living person an estate tail, instead of for life, and so enabling his son to succeed if the entail be not barred. See ENTAIL. So also, when a charity cannot reasonably be administered, precisely as directed by the testator, the court will, by the doctrine of C. P., administer it as near as possible to his directions.

Branch and Fruit of Cypress (*Cupressus sempervirens*).

CY'PRESS (*Cupressus*), a genus of plants of the order *Coniferæ*, the species of which are evergreen trees or shrubs, with small generally appressed and imbricated leaves, and with almost globular cones, the scales of which bear numerous hard seeds. The best known species is the COMMON C. (*C. sempervirens*), a native of the Levant, the north of Africa and the south of Europe, and sometimes met with in England. It is a tree of no great height, with quadruple twigs. The leaves are dark-green, and the tree has, therefore, a sombre aspect, and from very early times has been an emblem of mourning; the Greeks and Romans put its twigs in the coffins of the dead, they used it to indicate the house of mourning, and planted it about burial-grounds, as is still the custom in the East.

The wood of the C. is yellow or reddish, and has a pleasant smell. It is very hard, compact, and durable; the ancients reckoned it indestructible; and the resin which it contains gives it the property of resisting for a long time the action of water. It is not liable to the attacks of insects, and was formerly much esteemed for the purposes of the cabinet-maker. Some believe that the C. is the true cedar-wood of Scripture, and it has also been supposed that it is *Gopher wood*. Specimens of this wood are in existence in museums, which are known to be several thousands of years old. The doors of St. Peters's at Rome, made of C., lasted from the time of Constantine the Great to that of Pope Eugene IV., above 1100 years, and were perfectly sound when at last removed, that brazen ones might be substituted. Medicinal virtues were formerly ascribed both to the wood and seeds of the C. and the balsamic exhalations of the tree were reckoned very salutary in diseases of the chest.—Several other species of C. are natives of temperate and warm climates in different parts of the world. There are many species, the principal of which are the Portugal C. or Cedar of Goa (*C. Lusitanica*), a native of Goa, naturalized in Portugal; *C. thurifera*, a native of Mexico, which exudes a resin used in that country for incense; *C. torulosa*, a native of the Himalaya, and which has been grown successfully in Britain; *C. funebris*, lately introduced into Britain from China; the White C. or White Cedar of North America (*C. thyoides*). The Deciduous C. or Virginia C. (*Taxodium distichum*, or *Schubertia disticha*) is now regarded as belonging to a different genus, and attaining a height of 120 feet, and found in the cypress swamps of Delaware and elsewhere.

CY'PRIAN, THASCIUS CÆCILIUS, an illustrious father of the African Church, was born in Carthage about the beginning of the 3d century. He belonged to a respectable family, and was a distinguished teacher of rhetoric before his conversion to Christianity, which took place 246 A.D. His benevolence secured for him a high degree of popularity, and his piety no less veneration, in consequence of which he was made bishop of his native city in less than three years. In 250 he fled into the desert, to avoid the persecution of Decius. Here he remained a whole year, but not in idleness. The same prudence, energy, and activity that he had always displayed, were now shown in that extensive correspondence which he carried on with his clergy on ecclesiastical matters. On his return to Carthage in 251, he suppressed, but with moderation, the rising controversy regarding the *Lapsed* (q. v.), or Christians who, during the time of trial, had apostatized. C.'s views regarding the proper dignity of the Bishop of Rome have frequently been mistaken: he, indeed, recognized the Roman bishop as the successor of Peter, and as the representative of the unity of the church; but he asserted that the pre-eminence of the Roman see was confined to the earliest times, and that, in later times, other bishops, or successors of the apostles, had dignities equal to that of the successors of Peter.

He therefore firmly opposed the supremacy asserted by the Roman bishop, Stephanus, in the question of baptism by heretics. In the persecution under Valerian, 257, C. was banished to Curubis; but having returned to Carthage in the following year, he was there beheaded. C. was both a learned and eloquent divine, but he was even more conspicuous for his dignified, moderate, and wise conduct. His knowledge of human nature enabled him to exercise a wide influence over the African Church; and his correspondence, from which the best idea of his character is obtained, gives us an interesting picture of the times in which he lived. His writings—less crabbed and rhetorical than those of his teacher, Tertullian—contain, besides 81 *Epistolæ*, or official letters, several important treatises, among which may be mentioned the *De Unitate Ecclesiæ Catholicæ*, the *De Lapsis*, the *De Disciplina et Habitu Virginum*, the *De Gratia Dei*, and the *De Idolorum Vanitate*. The best editions of C.'s complete works are that of Fell, Bishop of Oxford (1682), and that of Baluze (Paris 1726). There are many lives of C. One of the most recent is by Reinkens (1873).

CYPRI'NIDÆ, a family of malacopterous fishes, having a small mouth, the jaws almost toothless, but the pharynx or hinder part of the mouth furnished with teeth; the body generally covered with scales, the gill-rays few, and no adipose fin (like the second dorsal fin of the trout or salmon). The genera and species are numerous. All the C. are fresh-water fishes. They are found in the lakes and rivers of almost all parts of the world. To this family belong the Carp, Dace, Tench, Bleak, Bream, Barbel, Minnow, Gold Fish, Roach, Loach, &c. Many of the species are much esteemed for the table. The fecundity of the C. is great.

CYPRINODO'NTIDÆ, a family of malacopterous fishes, allied to *Cyprinidæ*, with which they were formerly ranked, but differing from them in having the jaws more protractile and toothed. Some of them are American, some Asiatic; some inhabit fresh, and some salt water. To this order belong some interesting and curious fishes, particularly the Anableps (q. v.), remarkable for the conformation of its eyes. The species of the genus *Orestias* are found in the lakes of the Andes, at a great elevation above the sea, and are highly esteemed for the table.

CY'PRIS, a genus of minute entomostracous crustaceans of the order *Branchiopoda* (q. v.), having the body enclosed in a shell of two horny pieces, somewhat resembling that of a bivalve mollusc. The antennæ and feet are beautifully feathered with long fringed bristles, by means of which these animals swim with much vivacity. They abound in every pool of stagnant water. Their horny shells are very abundant in a fossil state in the Wealden rocks of England, in the limestone of the carboniferous series, &c.

CY'PRUS (Anc. Gr. *Kupros*, Mod. Gr. *Kibris*, Fr. *Chipre*, Ital. *Cipro*), an island situated south of Asia Minor, in that portion of the Mediterranean called the Levant. C. was anciently divided into many small kingdoms. It was originally possessed by the Phœnicians, from whom it passed to the Greeks, and subsequently to the Egyptians and Persians. After the victories of Alexander, it declared for Macedon. It next became a portion of the Græco-Egyptian kingdom of the Ptolemies, then of the Roman and Byzantine empires. The Arabs conquered it 648 A.D.; in 1191, it was taken by Richard Cœur-de-Lion, who ceded it to the Templars. After several vicissitudes, it came into the possession of the Venetians, from whom it was finally conquered by the Turks in 1571. The 'conditional convention' concluded between the English and Turkish governments in 1878, leaves C. a Turkish possession, but provides for its being occupied and administered by England.

C. is nearly 150 miles long by 55 broad, has an area of 3700 square miles, and a pop. in 1881 of 135,869. A range of mountains —the Stavro Vuno and Santa Croce (ancient *Olympus*)—the sides of which are very bold and rugged, runs through the whole length of the island, attaining an elevation of more than 7000 feet above the sea. Three-fifths of the island is mountainous. Of these one-fifth has splendid forests of oak interspersed with walnut-trees, and would furnish large supplies of sulphur, pit-coal, and metals of various kinds, under intelligent management; while two-fifths is adapted for vine and olive culture, and the growth of fruit-trees generally. 'The remaining two-fifths is composed of magnificent plains, and extensive open country, which, though wanting in rivers and streams, are still very productive in cereals.' The soil is exceedingly fertile, yielding all kinds of grain. The chief products are wheat, barley, cotton, silk, madder roots, oil, wine, carobs, and salt. The wine of Cyprus is still excellent. The chief drawbacks to production, besides mismanagement, are the want of water—most of the streams becoming dry in summer—and the ravages of the locusts. It is said that there are good crops only twice in five years. The climate varies in various parts of the island; in the central plain, and about Larnaca, the summer heat is intense, especially from the middle of September till the end of October. Fevers, seldom fatal, are prevalent in the hot months. The first year of the English occupation, 1878, was exceptionally unhealthy both for natives and foreigners; 1879 and 1880 were 'extremely healthy.' The planting of trees, hitherto recklessly extirpated, will doubtless improve the climate and help

to fertilize again the more arid regions. Some swamps might with advantage be drained. Several roads have been made.

The English, in entering on the administration, endeavored in the main to improve, not to overthrow, the existing Turkish system. The courts of justice, having English assessors, became pure and were made less dilatory. Tithes were retained, but their collection simplified. Several rather high-handed ordinances, designed to prevent disturbance during a transition period, were gradually withdrawn; and in 1880 it was arranged that the administration of C. should be transferred from the Foreign Office to the Colonial Office.

The exports were valued (1878) at £157,328; (1879) £222,218. The imports (1878) £177,651; (1879) £208,407. The revenue in 1878 was £3,785,273; in 1879, £4,754,497. In 1879, 3639 ships entered and cleared the half-dozen harbors of C., the tonnage of those entering being 226,367 tons. The chief towns are Lefkosia or Nicosia, the capital; Famagosta; Larnaca; and Limassol. In 1871, C. was connected by telegraph with Syria.

See works on C., published in 1878 and 1879 by R. H. Lang, Hepworth Dixon, E. G. Ravenstein, Sir Samuel Baker, and Mrs. Stevenson, also the *Report by H. M. Commissioner* for 1879 (1880); and for archæology, Cesnola's Cyprus (1877).

CYR, St., the name of several places in France, the most important of which is St. C., in the department of Seine-et-Oise, about 3 miles west of Versailles. Pop. (1876) 1695. The village owes its origin to an educational institution for the daughters of nobles of fourth descent on the father's side, founded here in 1686 by Louis XIV., on the suggestion of Madame de Maintenon. There were about 250 pupils, for whom Racine wrote his tragedies of *Esther* and *Athalie*. Madame de Maintenon died here, and was buried in the choir of the church. The institution was suppressed at the Revolution. In 1803, the buildings were converted by Napoleon into a military school, as it still continues to be.

CYRENA'IC SCHOOL. See ARISTIPPUS.

CYRENA'ICA, the name of the district whose capital was Cyrene (q. v.). At one period, it nominally stretched from Carthage to Egypt, and extended inland as far south as the oasis of Fezzan; but a great portion of this territory was occupied by the subject Libyan tribes, and not by the Greek colonists, who were confined chiefly to the plateau of Barca, with the subjacent coast. This portion of C. was, and still is one of the loveliest and most agreeable regions of the world. The climate is delicious, mountains on the south sheltering the land from the scorching blasts of the Sahara, and cool sea-winds fanning it on the north. From the central plateau, whose breadth is about 80 miles, the land slopes down in verdant terraces to the Mediterranean.

These terraces are cut and watered by mountain streams, forming luxuriant ravines. The productions of C. mentioned by ancient writers are corn, oil, wine, honey, fruits of all kinds, cucumbers, truffles, cabbage; flowers yielding the richest perfumes; and a rare plant called *silphium* (still abundant), from which was obtained the gum-resin, greatly esteemed for medicinal purposes. The country was also celebrated for its breed of horses, but was much exposed to the ravages of locusts. Ancient C., which nearly corresponds with modern Barca (q. v.), was overrun by the Arabs in 647 A.D.

CYRE'NÉ, the capital of Cyrenaica (q. v.), was founded, 631 B.C., by a colony of Spartans under Battus, whose dynasty lasted for nearly two centuries. During this period, it made rapid advances. On the death of Arcesilaus IV., the last of the Battidæ, about 450 B.C., a republic was established, but the political condition of the city under the new government was far from prosperous. Party contests raged, until at last it fell into the hands of the Romans. During its prosperity, C. carried on a great commerce with Greece and Egypt, and to a less extent with Carthage. Its extensive ruins still attest its former magnificence. C. was the birthplace of the philosophers Aristippus, Anniceris, and Carneades, the poet Callimachus, the astronomer Eratosthenes, and the rhetorician Synesius, who afterwards became bishop of Apollonia.

CYRIL, St., Bishop of Alexandria, was one of the most energetic, but least amiable of the Church Fathers. The date of his birth is not known. He was educated by the fanatical monks of Nitria, with whom he lived for five years, and who probably inspired him with that fiery, intolerant, and ignorant zeal which characterized him through life. Subsequently, he went to Alexandria, where he became a presbyter, and on the death of his uncle, Theophilus, 412 A.D., obtained the episcopal see. The Alexandrian Jews, who were numerous and wealthy, were the first to feel the fierceness of his religious hate. Some Christian blood having been shed by them in a city tumult, C. put himself at the head of a rabble of zealots, attacked the Jewish quarter of Alexandria, destroyed the houses, and banished the inhabitants. Orestes, the prefect of Egypt, having drawn up an accusation against C., was attacked in the streets by 500 monks, who had come up from the deserts of Nitria, at the call of their old companion, eager for the work of destruction. One of these monks having fallen in the skirmish, his corpse was carried in procession to the High Church of Alexandria, where C. delivered a sanguinary discourse, gave the dead monk the name of *Thaumasius*, and pronounced him a martyr and a saint. But perhaps the most barbarous deed with which this persecutor of heretics and heathens had to do, was the murder of the heathen maiden Hypatia (q. v.), the daughter of the mathematician Theon.

Theodoret gravely accuses him of instigating the Alexandrian populace to this horrid act. But the most important historic event in his career was his controversy with Nestorius (q. v.). All the worst features of his disposition appeared in this broil. Even the gentle Neander overflows with pious wrath, and pursues C. through sixty pages of his *Church History* with the fiercest epithets. In the midst of unquietudes, which he himself had largely occasioned, he died 444 A.D. C.'s numerous writings consist of commentaries, treatises, homilies, epistles, &c. The best edition was published by Aubert (7 vols., Paris, 1638). See Neander's *Kirchengeschicthe*, transl. by Bohn, vol. iv. pp. 133—196.

CY'RIL, St., Bishop of Jerusalem, an eminent Church Father, was born at Jerusalem about 315 A.D., and ordained a deacon in 334, a presbyter in 345, and on the death of Maximus in 351, was elected bishop of his native city. His metropolitan was the Arian bishop, Acacius of Cæsarea, with whom he was soon engaged in hot conflict concerning originally the rights of his office, but ultimately their differences of doctrine. Acacius accused C., before a council hastily 'got up' at Cæsarea in 358, of selling the treasures of his church in a time of famine to feed the poor! Strange to say, C. was deposed for doing this praiseworthy action. He now appealed to a larger synod, which was held at Seleuceia. This synod restored him to his office; but once more, through the persevering hostility of Acacius, he was deposed by a council assembled at Constantinople in 360. On the death of the Emperor Constantius, he was again restored to his episcopate in 362. Soon after, his old enemy Acacius died, but C. was immediately involved in new difficulties. After considerable strife, C. was banished, by order of the Emperor Valens, in 367; nor did he return tilll the emperor's death in 378. He died in 386.

C.'s writings are extremely valuable, not on account of their vigor, profundity, or beauty, but on account of their theology. They consist of 23 treatises, 18 of which are addressed to catechumens, and 5 to the newly baptized. The former are for the most part *doctrinal*, and present to us in a more complete and systematic manner than the writings of any other Father the creed of the church; the latter are *ritual*, and give us a minute account of baptism, chrism, and the Lord's Supper. Their style is simple and unattractive. The best edition of C.'s works is that published by Touttée, the Benedictine monk (Par. 1720).

CYRIL, the apostle of the Slaves (in the 9th c.), sprang from a respectable family living in the half-Slavic, half-Greek town of Thessalonica. On account of his knowledge, he obtained the surname of the Philosopher. Having been consecrated a priest, he went forth, during the reign of the Byzantine emperor, Michael III., to evangelize the Chasars, who dwelt by the Caspian Sea. His labors were very successful, the khan himself being among his converts. Boris, the heathen prince of Bulgaria, having about this time besought the patriarch of Constantinople to send him a preacher of the gospel, C., along with his brother Method, were selected.

Their labors were not in vain. Boris was baptised in 860. Rastic, prince of Moravia, next invited them to his country. They accepted the invitation, and while there, assisted by a number of their own pupils, completed their translation of the Holy Scriptures, which is in use to the present day, as a sacred or church language, among all Greek-Catholic Christians (Russians, Bulgarians, and Serbs). From Moravia, Christianity, according to the Slavic ritual, spread into Bohemia, whose prince, Boriwoj, and his spouse, Ludmilla, were baptized by Cyril. C. died in 869. The *Apologi Morales*, ascribed to C., were published by Corter (Vienna, 1630). See Richter's *Cyril and Method* (Olmütz, 1825).

CY'RUS, the founder of the Persian monarchy, commonly called C. THE ELDER, was, according to Herodotus, the son of Cambyses, a Persian noble, and of Mandane, daughter of Astyages, the Medo-Persian king. His birth was a source of alarm to his grandfather Astyages, who had previously had a dream, the interpretation of which portended that the offspring of Mandane would one day be the ruin of the Median supremacy and the ruler of all Asia. He therefore contrived to get the infant into his own hands, and gave it to Harpagus, his chief servant, with orders to put it to death. Harpagus promised to do so, but intrusted it privately to the care of a herdsman, who brought it up along with his own children. The young C. quickly distinguished himself among the country lads by his superior daring and dignity. On one occasion, he was elected king in some boyish game by his companions, and in the exercise of his regal authority, caused a nobleman's

son to be severely scourged. The father complained to Astyages, who caused the culprit to be brought before him, and recognizing in his person and mien his own grandson, sent C. back to Persia —the Magi having in some way satisfied him that his dream had already received its fulfilment. C. himself, however, did not think so, and as he grew up to manhood, began to meditate ambitious schemes. All writers testify to his courage, amiability, and address. He was exactly the kind of man to gather round him brave, venturesome, loyal followers. The tyranny of Astyages had made him hateful to his subjects, and by the help of the crafty Harpagus, C. soon formed a party among the Medes favorable to his designs. Putting himself at the head of his Persian troops, C. advanced into Media, and overthrew the forces of Astyages (559 B.C). After consolidating his new dominions, which seem to have cost him many years' labor, he proceeded in his career of conquest. The kingdom of Lydia first yielded (546 B.C.), and its king, the famous Crœsus, fell into his hands. Ultimately, the whole of Asia Minor was subdued.

But the crowning triumph of C. was his capture of the city of Babylon, the metropolis of Assyria (538 B.C.), whose king was Labynetus, the Belshazzar of Daniel. Through the instrumentality of C., the Jews were delivered from their captivity, and allowed to return to Palestine. His vast ambition, however, proved his ruin. He wished his power to overshadow all Asia, in harmony with the dream of his grandfather; and although his dominions already extended from the Hellespont almost to the Indus, he resolved to subjugate the Scythian peoples, and began an unjust war with the Massagetæ, a nation or tribe who dwelt to the north-east of the Caspian, beyond the Araxes, whose queen was called Tomyris. At first C. was successful, but in a second engagement he was defeated and slain (529 B.C.).

Such is the account given by Herodotus, and although we are unable to affirm that it rests on absolutely historical ground, it is unquestionably to be preferred to any other. The work of Xenophon, entitled the *Cyropædeia*, is not a history; it is a historical romance, and was manifestly intended by the author for such. Xenophon wished to picture a great and wise king, and finding the elements both of greatness and wisdom in C., he took advantage of his historic personality, and engrafted upon it whatever, according to his own notion, would ennoble and dignify it.

CYRUS, THE YOUNGER, the second of the sons of Darius Nothus, or Ochus, lived about 130 years after the great Cyrus. He conspired against his brother Artaxerxes Mnemon, who had succeeded to the throne (404 B.C.). The plot, however, being discovered, he was at first sentenced to death, but afterwards pardoned, and even restored to his dignity as satrap of Asia Minor. Here he employed himself in making arrangements for war against his brother, although he concealed his purposes to the very last. In the spring of 401 B.C., he left Sardis at the head of 100,000 Asiatics, and 13,000 Greek mercenaries, under pretence of chastising the robbers of Pisidia. Artaxerxes being warned of C.'s perfidy, made preparations to oppose him, and the two armies encountered each other in the plains of Cunaxa, 500 stadia from Babylon. C. was defeated and slain, although the Greeks fought with the greatest courage, and even routed that portion of Artaxerxes' troops immediately opposed to them. The fortunes of the Greeks, on their retreat through the highlands of Armenia, in severe winter-weather, are recorded by Xenophon in his *Anabasis* (q. v.).

CYST (*kystis*, a bladder), a word sometimes used in the original sense as applied to hollow organs with thin walls, as the urinary bladder and gall bladder; but commonly reserved for the designation of pathological structures or new formations within the body, having the bladder form. Cysts are commonly transparent, and often almost structureless in their tenuity; they are commonly, however, lined by an Epithelium (q. v.), and have membranous walls, with faint indications of fibrous structure.

They are either simple or compound, unilocular or multilocular; they are sometimes small, numerous, and separate; in other cases, they grow to an enormous size, and are very complex. Some cysts are distinctly parasitic, and of independent animal nature; such are Hydatids (q. v.) and the cystic Entozoa (q. v.) generally. Others are probably formed out of the structures in which they arise, their true pathology being, however, obscure. Such are the cysts of the kidney, and still more distinctly, the immense complex cystic structures which form in the ovary. See OVARIES.

CYSTIC WORMS, an order of *Entozoa*, or Intestinal Worms, according to the system of Zeder and Rudolphi, for some time generally received by naturalists, characterized by the body ending in a transparent cyst or bladder filled with pellucid fluid, this body having sometimes only one head, as in *Cysticercus*, sometimes many, as in *Cœnurus*. It has, however, been found that certain species, *Cysticercus cellulosæ* and *Cœnurus cerebralis*, are the young of cestoid worms, and it is therefore concluded as highly probable that all the C. W. are of the same nature, more particularly as all present the appearance of immaturity, in the want of visible organs of reproduction. Until a comparatively recent date, the animal nature of C. W. was not recognized, nor is it long since their relation to tape-worms and other cestoid worms has been fully ascertained. See CESTOID WORMS, CYSTICERCUS, ECHINOCOCCUS, STAGGERS, and TAPE-WORM.

CYSTICE'RCUS (Gr. bladder-tail), according to many naturalists, a genus of Cystic Worms (q. v.), characterized by a dilated cyst with a single head, which has four suckers and a circlet of hooks. This genus has, however, latterly been displaced from the system of nature by the discovery that the forms referred to it are only the young of tape-worms. This discovery has been confirmed by a multitude of observations and experiments with regard particularly to *C. cellulosæ*, found in human beings, and in many rodent and pachydermatous animals—as rabbits, pigs, &c.—the young of the common tape-worm; and *C. tenuicollis*, found more rarely in human beings, but often in the abdominal cavity of ruminant quadrupeds, and of pigs, horses, and many other animals—the young of a tape-worm of the dog. *C. cellulosæ* often exists in great numbers in the flesh of pigs, causing the diseased appearance known as *measly*. See CESTOID WORMS, where it is figured. It sometimes occurs in like manner infesting the human body, in muscles of most various parts; it has been found even in the heart, in the brain, and in the eye.

That in such cases it sometimes causes death, is too certain, and its removal is not easy, except when it is so situated that it can be reached by the knife, nor is there any sure indication by which its presence in many situations can be known; but it appears also that it may die and be absorbed without causing any very serious consequences to the person in whom it has dwelt. The cysts of this species are always of small size; those of *C. tenuicollis*, however, which generally occurs in the liver, or in other abdominal organs, sometimes become, in some of the lower animals, as large as a child's head. Injurious consequences are produced by them when either numerous or very large.—See Cobbold's *Entozoa*.

CY'STIN, or CY'STIC OXIDE, forms a rare variety of Calculus (q. v.). It contains $C_6H_6NO_4S_2$, has a crystalline texture, a brownish-yellow color, and is semi-transparent. It is not soluble in water, alcohol, or ether, but dissolves in the strong acids.

CYSTI'TIS. Inflammation of the urinary bladder (q. v.).

CY'TISUS, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, of which some of the species, having long twiggy branches, are popularly called BROOM (q. v.), others are called Laburnum (q. v.), whilst others still are generally known by the name Cytisus. The characters of the genus are stated in the article BROOM. The species are numerous—small trees or shrubs, with leaves of three leaflets, and yellow, white, or purple flowers, natives chiefly of the warmer temperate parts of the Old World. Many of them are very beautiful, and some are among the esteemed ornaments of our shrubberies, others of our greenhouses.

CY'TOBLAST. See CELLS.

CY'ZICUS, a peninsula of Anatolia, Asia Minor, projecting into the Sea of Marmora. It lies to the south-east of the island of Marmora, and about 70 miles south-west of Constantinople. It was at one time an island, but the gradual formation of an isthmus connected it with the mainland. Its length from south to north is about nine miles, and its breadth from east to west 18 miles. In early times, C. was a Milesian colony, and the city of C., upon whose site vineyards and orchards now flourish, is described by Strabo as one of the first cities in Asia, alike for extent and splendor.

CZACKI, TADEUSZ, an eminent Polish author, was born in 1765 at Poryck, in Volhynia. At the age of twenty, he obtained an office in the supreme justiciary court at Warsaw, and was also made director of the crown archives—a situation which enabled him to gratify his taste for Polish history. Some essays on Polish finance induced the diet to select him, in 1788, as a member of the commission of inquiry into the state of the revenue. His efforts to animate the industry and extend the commerce of his native country were most praiseworthy. A valuable result of his travels through Poland for this purpose is a map of its river-system. He also interested himself greatly in the navigation of the Dniester. At the second partition of Poland, he lost his property, but it was afterwards restored.

The chief labor of his life, however, was in connection with the education of his countrymen. His endeavors to instruct the people in the old Polish provinces of Russia, where education had been almost wholly neglected, met the approval of the Emperor Alexander. The most important of C.'s educational institutions was the gymnasium at Krzemieniec. In 1807, he was appointed the deputy of Prince Czartoryski, who had the care of public instruction in the Polish government of West Russia. C. died at Dubno, 8th February 1813. His writings prove the comprehensive character of his attainments. His most valuable work is upon

Lithuanian Law (*O Litewskich i Polskich Prawach*, 2 vols., War. 1800).

CZAR, more properly *Zar*, is a title of the Russian emperor. The word is derived from the old Slavonic language, and signifies much the same as Ger. *Kaiser*, Lat. *Cæsar*, to which it probably owes its origin; although some etymologists identify it with the termination of the names of the old Assyrian kings—such as Phalassar, Nabonassar, and Nabopolassar. After the 12th c., we find Russian annalists giving the title of C. to the Grand Duke Wladimir, Monomach (died 1125), and to several of his successors. In general, however, the rulers of the various Russian provinces were called Grand Dukes till the 16th century. Thus, we have the Grand Dukes of Wladimir, Kiew, Moscow, &c. The Grand Duke Wassilij Iwanowitch first assumed, in the year 1505, the title of *Samodershez*, which signifies autocrat. The son of Wassilij, Iwan II., Wassiljewitch the Cruel, caused himself to be solemnly crowned C., 16th January 1547. From this time, the Russian monarchs called themselves Czars of Moscow; and after the conquest of Little Russia and Smolensk, Czars of All the Russias. The word now became practically the equivalent of Emperor; yet Peter I., in 1724, thought fit to assume this latter title in addition; and as the Russian language had no term corresponding to it besides C., the Latin word *Imperator* was introduced, while the empress was termed *Imperatriza*. At first, several European powers refused to sanction the assumption of imperial dignity by the Russian C., but ultimately consented to do so. The wife of the C. was named Czariza (Czarina); the sons, Czarewitch; the daughters, Czarewna; but after the death of Alexei—Peter I.'s son—these titles were abolished, and the imperial princes were called Grand Dukes, and the Imperial princesses Grand Duchesses. In 1799, the Emperor Paul I, introduced the title of Cesarewitch (not Czarewitch) for his second son, the Grand Duke Constantine. The heir-apparent and his wife are still called Cesarevitch and Cesarevna. Among the Russian people themselves, the emperor is more frequently called Gossudar (Hospodar, i. e., Lord) than Czar.

CZARTORY'SKI, ADAM GEORGE, son of Prince Adam Casimir C., of an ancient Polish house, sometimes (but wrongly) said to be sprung from the Jagellons (q. v.), was born at Warsaw, 14th January 1770. Having completed an excellent education at Edinburgh and London, he returned to his native country, and took part against Russia in the war occurring on the second partition of Poland. On the defeat of the Poles C. was taken to St. Petersburg as a hostage, and here he exhibited so much ability and prudence as to gain the friendship of the Grand Duke Alexander, to whom he was attached, and the confidence of the Emperor Paul, who made him ambassador to Sardinia. When Alexander ascended the throne, he appointed C. assistant to the Minister of Foreign Affairs; and he took an active part in official life until after the peace of Tilsit. As curator of the university of Wilna, to which he was nominated in 1803 by Russia, he exerted all his influence to keep alive a spirit of nationality; and when some of the students were arrested on a charge of sedition, and sent to Siberia, C. resigned his office. His successor reported to the emperor, that the amalgamation of Russia and Lithuania had been delayed a century by C.'s occupancy of the curatorship. Russian favors could not deaden or even dull C.'s pure patriotism. Into the revolution of 1830 he threw himself with all his heart. He was elected president of a provisional government, and in this capacity summoned a national diet, which met, and in January 1831, declared the Polish throne vacant, and elected C. head of the government. He immediately devoted half of his large estates to the public service, and adopted energetic measures to meet the power of Russia, but in vain; the Poles were crushed, and C.—specially excluded from the general amnesty, and his estates in Poland confiscated—escaped to Paris, where he afterwards resided, the liberal friend of his poor expatriated countrymen, and the center of their hope of a revived nationality. In 1848, he liberated all his serfs in Galicia, and during the Crimean war he ineffectually endeavored to induce the Allies to identify the cause of Poland with that of Turkey. He died July 1861.

CZA'SLAU, a town of Bohemia, 45 miles east-south-east of Prague. Its deanery.church, in which the celebrated blind Hussite leader, General Ziska, was buried, is surmounted by the highest steeple in Bohemia. C. is also noted as the scene of an important victory gained over the Austrians by Frederick the Great, 17th May 1742. Pop. (1880) 6178. Here there are copper-works, manufactures of chicory, and beet-root sugar, and a distillery.

CZECHS, the most westerly branch of the great Slavic family of nations. About 451—495 A.D., the C. migrated from their lands in Carpathia, on the Upper Vistula, and came into the country now known as Bohemia. According to tradition, their chieftain was named Czech. Georgsberg, near Raudnitz, on the Elbe, is said to have been the first place chosen by the C. for their encampment. Other Slavic tribes migrated into Bohemia; but in the course of time the C. gained such an ascendency that, in the 9th c., the name C. was commonly applied to the whole Slavic population of Bohemia (q. v.). Here, in Moravia, and in other parts of Austria, the C. now number in all above 6,000,000.

CZE'GLED, a market-town of Hungary, 40 miles south-east of Pesth. It has some handsome buildings and large breweries. The inhabitants (1880) 24,872 in number, are employed principally in agricultural pursuits, the district around yielding much grain and red wine.

CZENSTOCHAU, or CZENSTOCHOWA, a monastery of the order of St. Paul the Hermit, in the Polish government of Kalisch. It is the most frequented place of pilgrimage in the whole country, and is celebrated throughout all the Slavonic nations. It occupies a commanding position on the Warthe, not far from the Silesian frontier, and possesses the famous dark-colored picture of the mother of Christ, which has given occasion to the worship of the Black Virgin by all the Polish Catholics. This picture is probably of Byzantine origin. According to the legend in connection with it, it was painted by Luke himself; passed into the hands of the Princess Helena; subsequently found its way through a Russian prince, Laon, to Belz in Galicia; and finally, through Wadyslaw, Duke of Oppeln, who built the monastery of C., was brought thither to assist him against the Tartars. In more recent times, C. is noted as being the only place in Poland which offered resistance to the army of Charles Gustavus, king of Sweden, on which occasion (1655 A.D.) the inmates, comprising 70 monks and 150 soldiers, withstood a siege of 38 days carried on by a Swedish force of 10,000 men. At a later period, however, C. lost its importance as a military position. At the foot of the eminence on which the monastery stands, lie two little towns, Old and New C., which carry on a considerable trade in holy pictures and amulets.

CZE'RNOWITZ, capital of Bukowina in Austria, situated on a hill near the right bank of the Pruth, about 140 miles south-east of Lemberg. It is the seat of a Greek archbishop; and in 1875 a university was founded here. The manufactures are fast developing. Pop. (1869) 33,884; (1880) 45,600.

CZE'RNY, GEORGE (Turkish, *Karadjordje*), i. e., Black George, the leader of the Servians in their struggles for independence, was born in 1770 in the neighborhood of Belgrade. He showed, when young, his hatred of the oppressors of his country by murdering a Moslem. After spending some time in Austria, he returned to his paternal estate. In August 1801, a band of janizaries broke into his dwelling, and plundered it. C. fled, vowing vengeance. He soon collected a band of malcontents, and commenced a sort of guerilla war. Gradually his numbers increased, and in 1804 he captured the fortress of Schabez. Subsequently, he invested Belgrade, and in the beginning of 1806 routed the Turks at the rivers Drina and Morawa. Assisted secretly by Russia, he captured Belgrade in December 1806. After the treaty of Slobosje (8th July 1808), he was elected governor by the people, and recognized as Prince of Servia by the sultan. The French invasion of Russia in 1812 compelled the latter country to let Servia shift for itself. Hostilities recommenced; the Turks were successful, and C. had to flee to Russia. He afterwards went to Austria, where he lived for some time. Meanwhile, the freedom of Servia had been secured through the leadership of Milosch Obrenowicz; and in July 1817, C. returned, intending, as some suppose, to rally his partisans round him for the furtherance of his ambitious schemes, when he was murdered at the instigation of Prince Milosch.

D.

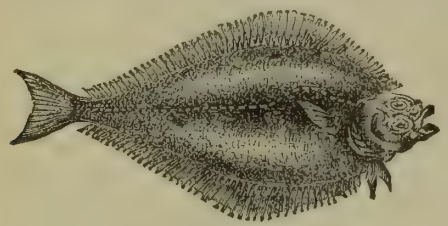
D THE fourth letter in the Græco-Roman alphabets, was called in the Semitic languages *daleth* (hence Gr. *delta*, i. e., 'door;' and in all probability its original hieroglyphic or picture form was a door. The Greek Δ, in fact, yet preserves a recognizable resemblance to the door or opening of a tent, the kind of door most familiar to a nomadic people. D. belongs to the order of letters called *dentals* (see LETTERS, ALPHABET), *t*, *d*, *th* (in *thin*), *th* (in *thine*), and in the corresponding words of sister-languages is often exchanged with those of the same order or organ; thus: Ger. *du*, Eng. *thou;* Ger. *tod*, Eng. *death;* Lat. *duc-*, Eng. *tug;* Lat. *duo*, Eng. *two*. A more remarkable interchange is that between *d* and *l*, and *d* and *r*. See L and R. D seems to have been drawn into some words (to which it does not radically belong) by a kind of affinity for *n*, as Lat. *canis*, Gr. *kyou*, Eng. *hound;* Lat. *gener-*, Eng. *gender*. *Di* followed by a vowel is sometimes transformed into J; as in *Janus* for *Dianus;* *Journal* from *diurnal*. *Di* followed by a vowel in Latin, has, in Italian, become *z;* and from MSS. and other evidence, we know that this sibilant sound of *di* prevailed, in the popular pronunciation at least, while Latin was yet a living tongue. Thus, *diabolus* is found written *zabolus*, and *Amazones, Amadiones*.—D, the Roman numeral for 500, arose out of the character Iↀ. See NUMERALS.

D, in Music, is the second note in the natural scale, and is a whole tone above C, to which it stands in mathematical proportion as 9 : 8, that is, when C vibrates eight times, D vibrates nine times. The whole tone from C to D is called the greater whole tone, being a comma larger than the next whole tone from D to E.

DA CA'PO (Ital. from the beginning), a term in Music, frequently placed at the end of a part or movement, indicating that the performer must return to the beginning of the movement, or to some other part of it usually marked with the sign :S:, and finish where the word *fine* is placed. Scarlatti was the first who introduced the use of the *da capo* in his opera of *Theodora*. The words are generally abbreviated thus, D. C., sometimes *D. C. al fine*.

DA VI'NCI, LEONARDO. See LEONARDO DA VINCI.

DAB (*Platessa limanda*), a fish of the same genus with the plaice and flounder, and very much resembling them, but easily distinguished from either of them by its more uniform and lighter-brown color, the roughness of its scaly surface, and its more curved lateral line, which rises into a high arch over the pectoral fin. It is common on all sandy parts of the British coasts, inhabits deeper water than the flounder, and does not, like it, enter the mouths of streams.



Dab (*Platessa limanda*).

It is known on the coasts of the Firth of Forth as the Salt-water Fluke. It is preferred to the flounder for the table. It seldom exceeds 12 inches in length. A rather larger species of the same genus, less plentiful on the British coasts, is the LEMON D. or SMOOTH 'D. (*P. microcephala*). Its body is smooth, its color a pretty mixture of various shades of reddish-brown and yellow: its head and mouth are very small.

DABCHICK. See GREBE.

DA'CCA, a city of Bengal Proper, stands about 190 miles to the north-east of Calcutta, in lat. 23° 43′ N., and long. 90° 25′ E. It is situated on the Burha Gunga, a considerable auxiliary of the Dulasseree, which is itself at once a mingled offset of the Brahmaputra and the Ganges, and an affluent of the lower course of the former stream. The city thus enjoys singular facilities in the way of inland navigation. Down to the close of the 18th c., D. was widely celebrated for the delicate texture of its muslins, which, in the phraseology of the East, were characterized as 'flowing water' and 'evening dew;' and, in connection with this manufacture, the French and the Dutch, as well as the English, had extensive establishments in the place. Since 1801, however, these European agencies have disappeared; while the annual value of the elegant fabric, under the influence of British competition, has gradually fallen from £250,000 to nothing at all. The present aspect of the city is in keeping with this utter decay of its staple trade. In many quarters are ruins overgrown with jungle, the haunts of tigers and serpents; and this remark is applicable to numerous splendid edifices, such as the residences of its native princes and the factories of its foreign sojourners. Still D., within a space of 4 miles in length by 1¼ in breadth, contains, by the census of 1872, 69,212 inhabitants. It seems, of late years, to have partially recovered from the effects of its commercial decline, and produces lac, dye, soap, cheese, and gold and silver ornaments. Sometimes as many as 300 elephants are for sale in the depôts here. There are 180 mosques and 119 pagodas and places of worship belonging to Romanists, Armenians, Greeks, and English, as also a college and several schools. D. is connected with Calcutta by the Eastern Bengal Railway. The maximum temperature in 1871 was 89°, and the minimum was 54·6°. The rainfall in 1871 was 82 inches.

DACCA, the district of which the above-mentioned city is the capital, extends in N. lat. from 23° 12′ to 24° 17′, and in E. long., from 90° 11′ to 90° 58′, containing 2897 square miles, and numbering (1872) 1,852,993 inhabitants. Forming part of the great delta of the Ganges and Brahmaputra, it is traversed by streams in every direction, being so low and level as to be generally flooded during the rainy season. It is, on this account, admirably adapted to the cultivation of rice. From the character of the country, roads—happily rendered less necessary by the net-work of rivers—are very difficult of construction. In addition to the city of its own name, the district has two principal towns, Narainganj and Islampoor. Though the climate, as a whole, is moist, yet it by no means presents uniformity in this respect, the annual rain-fall varying in different years from 46 to 93 inches. Among commercial crops, cotton—the raw material of the far-famed muslins—once occupied a prominent place. It is now comparatively neglected, being too short in the staple for the coarse fabrics which alone continue to be made in the district. Recent attempts to introduce a better variety from the United States have failed. It was in 1765—the epoch of the cession of Bengal, Bahar, and Orissa on the part of the Great Mogul—that D. became a subject to England; but down to 1845, the heirs of the native ruler succeeded each other as stipendiaries of the East India Company.

DACE, DARE, or DART (*Leuciscus vulgaris*), a fresh-water fish of the family *Cyprinidæ* (q. v.), and of the same genus with the roach, ide, chub, bleak, minnow, &c. It chiefly inhabits the deep and clear water of quiet streams. It is found in Italy, France, Germany, &c., and in some of the rivers of England, but is very local. It is in form not unlike the roach, but rather more elongated; the mouth is rather larger, the scales smaller. The upper parts are dusky blue, becoming paler on sides, and passing into white on the belly, the cheek and gill-covers silvery white. The D. is gregarious, and swims in shoals. Its flesh is preferred to that of the roach, but is not highly esteemed. The D. is perhaps the liveliest and most active of the *Cyprinidæ*, and affords the angler fair sport both with fly and bait. It is fished for with a light float and a fine gut-line. The float is set so that the bait may almost touch the bottom. At the least symptom of a bite, the angler must strike quickly. The best baits are the red-worm, the tail of a lob-worm, gentles, greaves, and flies or grubs of any kind. The best places to fish with bait are moderately sharp streams, of from two to four feet deep. Dace at times take the fly very freely, and show capital sport.

Small red and black palmers will be found the most useful flies for the purpose, and their killing properties will be greatly increased if the hook is tipped with a tough gentle, as D. are very apt to follow the fly without taking it, when the gentle overcomes their scruples; a small piece of the white, tough, inner rind of bacon answers equally well; and even a small piece of wash-leather may be used. Shallows, scours, and by the edge of weed-beds, are the best spots for the fly. D. may be taken also by 'dapping' with the natural fly, and those so taken are usually

the finest fish. D. seldom exceed a pound in weight, though in some rivers they have been taken up to 1½ lbs. In the Thames, a fish of half a pound is considered unusual. They spawn in the

Dace (*Leuciscus vulgaris*.)

end of April, or early in May, and soon recover their condition again.

DA'CIA, the land of the Daci or Getæ. Its geographical limits were very indefinite until its conquest by the Romans. After that period, it comprised the various countries now known as Eastern Hungary, Transylvania, Bukowina, Moldavia west of the Pruth, Wallachia, and the Banat of Temesvár. The Getæ came originally from Thrace, and were divided into various tribes. Their course northward can only be imperfectly traced; but we know that, shortly before the time of Alexander the Great (335 B.C.), they had migrated across the Danube. It is not known when or for what reason the Getæ changed their name to Daci. They seem to have been the most valiant of the Thracian barbarians. Curio, the first Roman general who ever penetrated as far north as the Danube, did not venture to assail them. Julius Cæsar, however, is said to have intended their subjugation. In 10 B.C. Augustus sent an army up the valley of the Maros. From this time, there was almost continual fighting between the Romans and the Daci, on the whole, to the advantage of the latter, who actually compelled their civilized enemies, in the reign of Domitian, to pay tribute. In 101 A.D., the Emperor Trajan crossed the Theiss, and marched into Transylvania, where he fought a great battle near Thorda. The peasant calls the battle-field to the present day *Prat de Trajan* (*Pratum Trajani*, field of Trajan). The Daci, who were commanded by their famous chief Decebalus, were defeated. A second expedition of the emperor's (104 A.D.) resulted in the destruction of their capital, the death of Decebalus, and the loss of their freedom. Roman colonists were sent into the country, a bridge was built over the Danube—the ruins of which are still extant—and three great roads were constructed. In 270—275 A.D., the Romans abandoned the country to the Goths, and the colonists were transferred to Mœsia. After a series of vicissitudes, D. fell into the possession of the Magyars in the 9th century.

DACIER, ANDRE, a French author, born of Protestant parents at Castres, in Upper Languedoc, 6th April 1651, studied at Saumur; and in 1672 came to Paris, where he was employed to bring out an edition of the Latin writer *Festus*, for the use of the dauphin, which he did in 1681. In 1683, he married Anna Lefèvre, also a Protestant, and two years later, both entered the Roman Catholic Church.

D. subsequently became royal librarian, member of the Academie des Inscriptions, and perpetual secretary of the 'Academie.' He died 18th September 1722. D.'s principal works, besides his *Festus*, are *Œuvres d'Horace en Latin et en Français* (Par. 1681—1689), an edition of Valerius Flaccus, and numerous translations into French of Greek authors, such as Plutarch and Epictetus, all of which are of very middling quality, while the expositions and criticisms are extremely shallow.

ANNE DACIER, wife of the preceding, was born at Saumur in 1651, and after the death of her learned father, who had developed her talent, came to Paris, where she acquired such a reputation by her edition of Callimachus (1674), that the Duke of Montausier commissioned her to edit several of the ancient authors for the use of the dauphin. Similarity of tastes and employment led to a marriage between her and André Dacier. Her domestic duties did not, however, weaken her literary ardor. Besides editing various of the classics, she translated the comedies of Terence; several plays of Plautus, with an able dissertation; and portions of Anacreon, Sappho, and Aristophanes. Her admiration of Homer was unbounded, and involved her in two learned controversies. She died 17th August 1720.

DACOI'TS, a name used for brigands herding in gangs in various parts of India, and living by *dacoity* or systematic robbery. They are now rarely heard of in British India.

DACOI'TS, or DACO'TAH INDIANS, in the United States. See SIOUX and INDIANS.

DACRY'DIUM, a genus of trees of the natural order *Taxaceæ*, having male and female flowers on separate trees. The species are lofty trees, chiefly natives of Australia and New Zealand. *D. Franklinii* is called HUON PINE, although rather a yew than a pine. Its timber is harder than any Baltic pine, and is excellent for spars for naval purposes. *D. taxifolium*, the Kakaterra Tree of New Zealand, attains a height of 200 feet, and is also very valuable for its timber. A beverage resembling spruce-beer is made from its branches.

DA'CTYL (Gr. *dactylos*, the finger), the name of a measure or 'foot' in Greek and Latin versification, consisting of a long and two short syllables, as in the word *omnibus*. It was called from its resemblance to the finger, which consists of three joints—one long and two short. The same name is sometimes applied to a trisyllabic measure in English verse, consisting of one accented syllable and two unaccented syllables, as in *déstiny*. See VERSE. Dactylic verses consist of dactyls and equivalent feet. See HEXAMETER.

DA'CTYLIS. See COCK'S-FOOT GRASS.

DACTYLO'LOGY, the art of communicating thoughts by the fingers. See DEAF AND DUMB.

DACTYLO'PTERUS. See FLYING GURNARD.

DA'DO (Ital. a die), in classical Architecture, the term applied to the cubic block which forms the body of a pedestal. It is also applied to the plane face and the series of mouldings which, in the interiors of buildings, form, as it were, a continuous pedestal. The interior D. is formed of wood, and, running round the bottom of the walls of a room, serves to protect the plaster or paper from injury. It is generally about three feet in height, and surmounted by a narrow cornice.

DADU'R, a town of Beloochistan, is five miles to the east of the Bolan Pass. Though it is in the 30th degree of N. lat., yet it is said to be one of the hottest places in the world. It contains about 3000 inhabitants. It is worthy of notice chiefly as the spot where, in November 1840, the British troops routed a Kelat force. The neighborhood yields grains of various kinds, pulse, cotton, sugar, madder and fruits.

DÆ'DALUS, according to the Greek myths, was sprung from the old Athenian race of kings, the Erechtheidæ, and was a contemporary of Theseus and Minos. He was famous for his ability as an artist and mechanician. Among the numberless works which he is said to have executed, may be mentioned the Cretan labyrinth, the Colymbethra, or reservoir, near Megaris in Sicily, the temples of Apollo at Capua and Cumæ, that of Artemis Britomartis in Crete, and an altar sculptured with lions on the Libyan coast. His mechanical genius is clearly celebrated in the poetic fiction of his flying safely over the Ægean by means of wings which he had himself made. D. got the credit among the Greeks of having invented carpentry, and most of its tools, such as the saw, the axe, the plumb-line, the gimlet, as also glue. The history of D. is obviously a myth, wherein, as recent criticism has conclusively shown, is embodied that epoch in which the first rude forms of art were thrown aside, and a higher skill and intelligence displayed.

DAENDELS, HERMANN WILHELM, a Dutch general, was born 1762 at Hattem, in Gueldres, took part in the revolutionary disturbances that broke out in Holland in 1787, and was in consequence compelled to seek refuge in France. In the campaign of 1793, he rendered important service to Demouriez, and was elevated to the rank of a general of brigade. In 1799 he commanded one of the two divisions of the republican army, which, with a third corps under the orders of General Brune, compelled the Anglo-Russian forces to surrender. Circumstances induced him to leave the service in 1803, but in 1806 he was re-instated in his former rank by the king of Holland. He now conquered East Friesland, and was made governor-general of Münster, commander-in-chief of the Dutch cavalry, marshal of Holland, and governor-general of the Dutch East Indian possessions. This last office he held from 1808 to 1811, and discharged its duties with great prudence. He also published a work upon his administration in Java, which was an important contribution to our knowledge of that island. On the overthrow of Napoleon, his services were secured by the new king of Holland, Wilhelm I., who intrusted him with the organization of government in those colonies on the coast of Africa which had been restored to the Dutch. In this capacity he labored with energy and success until his death in June 1818.

DA'FFODIL (corrupted from Lat. *asphodelus*), the English name of those species of *Narcissus* (q. v.) which have a large bell-shaped corona. The common D. (*N. pseudo-narcissus*) is a native of England and of most parts of Europe, growing in woods and hedges. It is naturalized in many places in Scotland, but seems scarcely indigenous. All the other species are more southerly, chiefly abounding in the countries near the Mediterranean. Some of them, as *N. minor*, have become naturalized in some places in England, having been long known as ornaments of gardens, in which double-flowered varieties are also cultivated. They are

favorites, not so much for their beauty, which is not of the most delicate kind, as on account of their large yellow flowers, which are produced early in spring. The bulbs are purgative and emetic. The mode of cultivation is the same as for other species of Narcissus.

DAG, a thick clumsy pistol, used in the 15th and 16th centuries. In the *Spanish Tragedy*, published in 1603, one of the characters shoots the dag.

DA'GGER, a weapon resembling a sword, but considerably smaller, being used for stabbing at close quarters. Daggers are generally two-edged, and very sharp towards the point. Originally, it had no guard for the hand, and was worn at the girdle in a sheath. It is now regarded as a general military weapon in European countries.

DAGHESTA'N (Tartar, *Tagh stan*, signifying mountainous country), a province of Asiatic Russia (called also Derbend), between the Caucasus and the west coast of the Caspian Sea. Area about 19,000 sq. m. Pop. (1880) 482,600. The surface is generally mountainous, being traversed by offsets from the Caucasus, but there are, however, valleys and level tracts of great fertility. The inhabitants are chiefly Lesghians (fanatical Mohammedans). Until 1812, the country belonged to Persia. Since its annexation by Russia, the Lesghians have fought desperately for independence (see SHAMYL and CAUCASUS). The chief town is Derbend (q. v.).—See *Daghestan*, by A. Cunynghame, 1872.

DA'GO, an island in the Baltic Sea, forming a part of the Russian government of Esthonia, situated near the entrance of the Gulf of Finland. The narrow channel called Sele-sund separates it from the island of Oesel on the south. Its length is estimated at about 34 miles, and its breadth at 15 miles. The soil, a mixture of sand and chalk for the most part, is not fertile, the coasts are rocky, and shoals make navigation dangerous. The population, Esthonians mostly, number about 10,000, and are chiefly employed in fishing and cattle-rearing.

DAGOBA, or DAHGOPA (according to Wilson, from *deha*, the body, and *gopa*, what possesses, because it contains the hair, teeth, &c., of Buddha; according to others, from *dhatu*, a relic, and *gabba*, a shrine), are monumental structures containing relics of Buddha. Dagoba seems to be the common Singhalese term for such monuments; but the more general name is Stupa or Tope (q. v.).

DA'GON (Heb. *dag*, a fish), the national idol of the Philistines, is frequently mentioned in Scripture; in profane history, the name by which it is known is Derceto. It is always represented on ancient medals as half-fish, half-woman, but the Hebrew writer or writers speak of it as a masculine being. Some scholars have attempted to show that the word D. comes from the Phœnician *dagan*, wheat; and that it is not the name of a fish-god, but of a god of agriculture. It is possible, however, to combine both notions, by supposing that D. was a deified mortal who had come in a ship to the coast, and taught the people agriculture and other useful arts. Ancient history abounds with such mythological personages, one of whom was called by the Babylonians *Odakon*, and is regarded by the learned Selden as identical with the fishy idol of the Philistines.

Dagon.

DAGUE'RREOTYPE PROCESS, the name given to the original photographic process as introduced by its inventor, M. Daguerre, in 1839. Notwithstanding that it has now become so unpopular, on account of the very circumstance which gives such perfection to the result—viz., the polish of the plate—it is a process which yields to none in point of microscopic perfection of detail and perfect gradation of shade. The pictures it yields are positive or direct, as given in the camera, though they also appear as negative when viewed at certain angles, and are the result of the successive action of the vapors of iodine, bromine, and mercury upon a highly polished surface of chemically pure silver. The manipulations involved in conducting the process are—1. Cleaning and polishing the plate; 2. Rendering the plate sensitive; 3. Exposing it in the camera; 4. Developing the latent image; 5. Fixing the picture.

A copper-plate of moderate thickness is coated with silver by the electrotype or other suitable method, and then polished to the utmost possible extent, so as to obtain, though by mechanical means, a chemically pure surface; it is then exposed first to the vapor of iodine, and then to the vapor of bromine for a length of time, ascertained in practice by watching the beautiful succession of prismatic colors which begin to appear with the first contact of the vapor. The length of exposure in the camera which follows is determined by the amount of light at the time of operating, and the relation between the diameter and focal length of lens employed. The development of the latent image, which is the next operation, is effected by exposing the plate in a suitable box to the vapor of mercury, which attaches itself to the various parts of the picture in proportion to the more or less intense action of the light.

Those portions of the iodide and bromide of silver unacted on by light, are next removed by immersing the plate in a solution of hyposulphite of soda; and the picture is subsequently fixed and intensified by pouring over its surface a solution of hyposulphite of gold, and applying heat; by which means it is coated with a thin film of metallic gold, and thereby rendered so permanent that it cannot be rubbed out by ordinary means, but requires a chemical solvent for its removal. It may be mentioned, in conclusion, that though M. Daguerre published, in 1839, the first *practicable* process for taking pictures by the agency of light, his experiments would seem to have been suggested by the researches of M. Niepce, who, in 1820, obtained impressions on silver plates rendered sensitive by exposure to the vapors of sulphur and phosphorus.

DAHL, JOHANN CHRISTIAN CLAUSEN, a Norwegian landscape painter, born at Bergen 24th February 1788, was at first intended for the church, but afterwards devoted himself to art. He studied painting for six years under the direction of Professor J. G. Moller. His first attempts were in *genre* and miniature. They did not exhibit much genius; but public attention was at length excited by a work which he exhibited in Dresden in 1819, entitled 'Cascade among Rocks in Norway.' Next year, he went to Italy, where Thorwaldsen and the Prussian consul-general, Bartholdy, commissioned him to execute several works. In 1821, he was appointed professor of painting at Dresden, where he subsequently resided. D. was fond of reproducing on his canvas the picturesque scenes of his native country, which he often revisited. Among his more famous works are a 'View of Naples,' 'Winter in Zeeland,' 'View of Bergen,' 'Scenes from the Environs of Christiana,' and a 'Winter Scene on the Banks of the Elbe,' the last two of which attracted great attention at the Paris Exhibition of 1855. D., who was a member of several academies, died at Dresden, 14th October, 1857.

DAHLGREN GUN, named after a naval officer in the service of the United States government, is the result of a careful series of experiments on the construction of large ordnance. One peculiarity consists in having relatively less metal in front of the trunnions, and more behind, than had hitherto been customary. Dahlgren guns, made to fire shells or hollow shot, have been introduced to a considerable extent in the United States navy.

DA'HLIA, a genus of large perennial herbaceous plants of the natural order *Compositæ*, sub-order *Corymbiferæ*, natives of Mexico. All the varieties in cultivation in our flower-gardens, of which not fewer than 2000 have been carefully enumerated, are derived from two species *D. variabilis* and *D. coccinea*, and chiefly from the former. Few plants manifest so strong an inclination to sport and produce new varieties as the D., and florists have also obtained many by the artificial fecundation of one with the pollen of another. Dahlias were first brought to Madrid by Spanish botanists in 1789, and were soon introduced into England, but did not become well known in English flower-gardens till about thirty years after.

The name was given in honor of Dahl, a Swedish botanist; but because another genus of plants had received the same name, an attempt was made to change it to *Georgina*, which is sometimes used on the continent, but D. universally prevails both popularly and among botanists in Britain. Among the most essential characteristics of a fine D., according to the estimation of florists, are a fulness of the flower, a perfect regularity in the shape of the florets, and the absence of an eye or disc; the florets of the disc, as in other 'double' *Corymbiferæ*, having assumed the appearance of florets of the ray. Dahlias have tuberous roots, which contain a considerable quantity of *Inulin* (q. v.), and are in use as an article of food in Mexico. It was at one time attempted to introduce them into cultivation in Europe for the food either of man or of cattle; but the taste is nauseous to European palates, and even cattle do not readily eat them. Dahlias are often cut down in the northern parts of Britain by early frosts, in the very midst of their flowering; and their tubers require to be taken up for the winter, and stored in a dry place out of the reach of the frost till spring. They are propagated by seed, by cutting, and by tubers. The finer varieties are sometimes grafted on more ordinary stocks.

DAHLMANN, FRIEDRICH CHRISTOPH, Professor of History and Political Science in the university of Bonn, was born, May 17, 1785, at Wismar. His earlier studies in Copenhagen and Halle were devoted to archæology and philology; but his attention was subsequently directed to the study of politics and the history of the middle ages. The results of his diligence appeared in his *Vita Ansgarii*, his *Researches in German History* (2 vols., Altona,

1822—1823), his edition of the *Ditmarsh Chronicle* (Kiel, 1827), and other works. In 1829, D. was appointed Professor of Political Science in Göttingen, where he published (1830) his valuable work on the *Sources of German History*. Banished in 1837, by King Ernest of Hanover, on account of his protest against the abolition of the Hanoverian constitution, he went to Leipsic and Jena, where he wrote his historical master-piece, the *History of Denmark* (3 vols., Hamburg, 1840—1843). In 1842, he became Professor of History at Bonn, and took a prominent part in the political affairs of Germany after the movement in 1848, heading the constitutional liberals, who were unfortunately too reasonable to be successful. At the close of the struggle, he returned to his academic duties, to which he devoted himself till his death, 5th December 1860.

DAHOMEY, an independent state of Guinea, Western Africa, extending along the coast from Fort Badagry on the east, to the river Volta, which separates it from Ashantee on the west. Its limits have not been precisely defined, but it is usually regarded as extending back to the Kong Mountains. It will thus lie between lat. 6°—8° 50′ N., and long. 0° 30′—3° E.; its breadth being about 200, and its length 180 miles. D. is for the most part a vast plain, rising with gentle ascent from the sea towards the Kong Mountains, with offsets of which it is traversed in its most northerly parts. Although it has no river of any importance save the Volta on its western boundary, it is well watered by springs and streams; and the soil, a rich, red-colored clay, almost quite free of stones, is extremely fertile.

Magnificent trees clothe the hills in the north, and maize, beans, and peas grow in splendid luxuriance on the plains, as well as yams, potatoes, melons, limes, oranges, pine-apples, and other tropical fruits; cotton, sugar, tobacco, and indigo are also raised. The scenery is described as exceedingly varied and beautiful. Lions, tigers, elephants, hyænas, and enormous snakes of the boa kind abound. The Dahomans, who came into possession of this tract of country about the beginning of the 18th c., are for the most part tall, well-formed, and intelligent, and, for an African race, singularly honest and far advanced in agriculture. With the exceptions of a few Mohammedans, whose religious belief is in no way interfered with, they are all pagans, and practise fetish-worship. The king is the most absolute of despots. Wholesale murder is one of the chief features in religious and state ceremonies; but, according to Captain Burton, who visited D. in 1864, the number of the victims has been greatly exaggerated. Still, as many as 500 human victims are sometimes sacrified at one 'grand custom;' the present king immolated that number at the death of his father. Of the regular army of 15,000, about 2500 are Amazons (devoted to celibacy), who are the most effective soldiers, but exceedingly ferocious. The revenue, until recent years, depended greatly upon the sale of slaves; but the vigilance of the cruisers employed to prevent the traffic has reduced this source of income materially. Hence the monster slave-hunts which periodically took place are now comparatively rare. In 1876 the coast of D. was placed under a strict blockade by Great Britain, on account of an outrage on a British subject, for which the king of D. refused satisfaction. Pop. 180,000.—ABOMEY, or AGBOME, the capital, is situated about lat. 7° 30′ N., long. 1° 40′ E. It is stated to be four miles in circumference, is surrounded by a ditch and clay walls, pierced by six gates, in each of which are two openings—one for the exclusive passage of the king, the other for his subjects. The houses are mostly of one story, built of clay, and thatched. There are no regular streets, each house standing within its own enclosure of clay wall. There are three palaces belonging to the king here, which differ little from the other houses, save in their greater size. Farms are cultivated within the city. Pop. about 20,000. The port of D. is Whydah.—See Forbes's *Dahomey and the Dahomans;* Burton's *Mission to Gelele, King of Dahomey;* Skertchly's *Dahomey as It is* (1874.)

DA'HRA, a district of Algeria, once inhabited by the Ouled-Riahs, a Kabyle tribe. It has acquired a melancholy celebrity as the scene of a frightful massacre perpetrated by the French in the month of June 1845. The district contains immense caverns. In these the Ogled-Riahs, hotly pursued by the French under Colonel (afterwards Marshal) Pelissier, took refuge. They were ordered to surrender their arms and horses, and were promised, in return, life and liberty. On their refusal, fascines were made up, kindled, and placed at the entrance of the caves.

Thrice Colonel Pelissier sent a flag of truce, exhorting the imprisoned Kabyles to accept his terms, but in vain—the last messenger being received with a discharge of musketry. The fire was therefore again kindled in all its intensity, and gradually the cries of agony from the interior of the caverns ceased, until nothing broke the dead silence but the occasional crackling of the green wood of which the fascines consisted. When the cavern swere examined, about 600 dead bodies were found scattered here and there; but it was calculated that in all (including those who afterwards died and those who could not be got at), about 800 had been suffocated by smoke, or gored to death by the maddened cattle whom they had brought with them into their fatal asylum. The news created a great sensation in Paris. Marshal Soult, then minister of war, formally condemned the deed; but Marshal Bageaud, the governor of Algeria, affirmed that Pelissier had only acted under positive orders.

DAIMIE'L, a town of Spain, in the province of Ciudad Real, twenty miles east-north-east of the city of that name. It is in general tolerably well built; it has several squares, and its principal streets, though unpaved, are wide and comparatively clean. Its chief buildings are the churches of San Pedro and Santa Maria —the former a Doric, and the latter a Gothic structure—a town-hall, and a hospital. D. is environed by fine public walks and gardens, and has manufactures of woollens, linen, blonde lace, &c. Pop. 10,000.

DAIR-EL-KA'MAR, or DEIR EL-KAMR, a town in Syria, and the capital of the Druses, about 13 miles south-south-east of Beyrout. It is situated on the edge of a deep and picturesque glen of Mount Lebanon, the banks of which and the slopes above are richly clad with mulberries, olives, and vines, which are cultivated in terraces by an exceedingly industrious population. On the opposite side of the glen stand the ruins of the palace Bteddîn, formerly the residence of Emîr Beshîr, who, for more than half a century, from 1788 to 1840, ruled over the Lebanon with a strong but impartial hand. Population of D. about 8000.

DAIRY, all that concerns milk and its management on a farm; or the place or house where the milk is kept, cheese made, &c. (The old word *dey*, the milkmaid who presided over the *deyry* or dairy, is probably allied to *dug*, a teat, and to Lat. *duc-*, to draw, or milk; in Polish, *doic* is to milk; and in Sw. *deja* is a dairy-maid.) Throughout the best cultivated districts, both of England and Scotland, the growing of corn and green crops, and the rearing and feeding of stock, were at one time to a considerable extent carried on in conjunction with the dairy. This mixed system of husbandry, though it may have reduced the farmer's risks, has gradually decreased. In many districts of the country, however, such as some parts of Ayrshire and Lanarkshire, the midland counties of England, and in Cork and neighboring Irish counties, great attention is still given to milk-cows, and dairy produce pays the bulk of the rent.

The selection of cattle of a sort profitable for the dairy, is a point of the first importance. Certain breeds have long been famed for their milking properties; at the head of these is generally placed the Ayrshires. In proportion to their small size, and the limited amount of food which they consume, they yield a large quantity of rich, good milk, and have been long and justly prized by the dairymen of Glasgow and other Scottish towns, as well as latterly by those in several districts of England, and Highland portions of Scotland. With all their superb milking properties, however, they are comparatively worthless as feeders or beef-producers unless crossed with the Short-horn. Some Ayrshire cows have been known to give from 18 to 20 quarts of milk daily, and yield 14 lbs. of butter per week. The cows of the Channel Islands also stand in high repute. The elegant, deer-like Alderneys are kept, more especially in England, by those who prize rich milk, and many landed proprietors and farmers have one or two amongst their herds to impart a higher color and richer flavor to the milk and butter. Alderneys frequently give 16 quarts of milk daily, and 8 or 9 lbs. of butter per week, while instances occur of their yielding as much as 12 or 14 lbs. The small Brittany breed, scarcely larger than goats, have also been brought to this country, and are profitable for gentlemen's families, and where only one or two cows are kept. These breeds are, however, in little favor with those who, besides dairying, look also to the breeding of profitable grazing-stock. Some families of the Short-horns unite, with size, substance, and aptitude for fattening, excellent milking properties. Short-horns, or animals with a large infusion of Short-horn blood, constitute the bulk of the handsome and high-priced cows seen in metropolitan markets, and long preferred to all others by the London dairymen. Throughout the north of England, such cows were in favor, and were used by the late Mr. Horsfall, whose excellent papers on dairy management, published in the *Journal of the Royal Agricultural Society of England*, should be read by all interested in this subject. With his liberal dietary, fifteen to twenty cows daily average, for seven or eight months, ten or eleven quarts of milk each, producing a pound of butter. The original Short-horns, in the hands of the Brothers Colling, Mr. Bates, the Earl Ducie, and other earlier breeders, were excellent milkers; and even at the present day certain families are to be found still retaining their ancient character. Of late, however, many breeders of our more fashionable and prize-taking Short-horns have devoted their undivided attention to early maturity, flesh, and quality, neglecting altogether the milking properties. This, in some respects, is to be regretted. Prize stock of this and some other breeds give no more milk now-a-days than fosters their calves, and some of them, indeed, make a poor

job of that. Many of the animals are thus never milked by the hand.

Herefords are not particularly famed for dairy purposes. The blood-red, plump Devons are more remarkable for the richness and butter-producing character of their milk than the quantity of it. The ancient Long-horns, once common in the midland counties of England, and prized for their milk, have mostly given place to more handy, symmetrical breeds. The old black Fife, or Scotch horned cows, included some famous milkers in their day, but scarcely any of them are to be met with now. The polled Angus, the Galloway, and the West Highland cows have a fair quantity of milk of remarkably fine quality, that of the West Highland breed in particular. The small Shetland breed produces an astounding quantity of splendid milk, and so do the Kerry and some other Irish cows.

Good milking animals of every breed possess certain qualities in common, which guide the farmer in profitably recruiting his dairy-stock. They have neat, tapering, well-placed heads; large, prominent bright eyes; small and rather narrow necks; light fore-quarters; oblique rather than upright shoulders; large and shapely udder, well under the belly; largely developed milk-veins; a pliant mellow skin, well covered with soft silky hair; thin tail, with a good brush at the end of it; small and fine below the knee. Of great importance, also, is the fact of the animals being descended of parents possessing good milking qualities, for certainly no property is more distinctly hereditary. The milk of small and young cows is usually richer than that of larger or older animals. From four to eight is the most profitable age of the dairy-cow; after that, the milk is poorer; the animals eat more food, especially during winter; and, moreover, become less profitable when dried for feeding. The stock is usually recruited by heifers bred on the farm, which are generally preferred to those bought in. Of course in the larger dairies about Glasgow, the west of Scotland, in the midland and southern counties of England, and in America, the cows cannot be all, or nearly all, bred and reared. Many must therefore be bought in, though they seldom turn out quite so well as the others. Heifers should not be put to the bull before they are two years old, and the milking properties of the animals will not be fully developed until they have had a second or third calf. Red and roan are the favorite colors.

In no department of the farm are carelessness and irregularity more injurious and ruinous than in the dairy portion. To produce large quantities of good milk, it is absolutely necessary that the cow be supplied with the materials which conduce to a great flow. These briefly consist of albuminous materials and phosphates for forming the caseine, and oily matters for producing the butter. In the ordinary or ancient dietary of cows, these materials, especially during winter, are seldom present in sufficient amount to produce, without waste, a copious flow of good milk.

Cows fed on meadow hay, when producing from 12 to 16 quarts of milk daily, require something more than 20 lbs. of turnips or mangold to sustain them. A still greater falling-off in flesh and fat—a constant robbing, in fact, of the materials of the body to supply the secretion of milk—is observed in the case of some milk cows kept on the Scotch system on straw and a full allowance of turnips. Under better management, the expensive hay and roots may be materially reduced in quantity, and the adequate amount of nutriment supplied by such articles as bean-flour, rape, or cotton cakes, bran, malt coombes, and the like; whilst sufficient bulk—an important matter in the feeding especially of ruminants—is attained by the use of chopped straw. The cutting of straw into chaff insures the eating of a larger amount, and thus becomes nearly twice as valuable as when employed merely as litter. Bean-straw, when steamed or fermented with pulped or grated roots, loses entirely its bitter flavor, and being rich in albuminous matters, is specially adapted for milking-cows. A portion of the roots, or all of them where the supply is small, should be pulped, mixed with the cut chaff, and the mixture allowed to lie in a heap for a day or two before being used. With the roots should be added 3 or 4 lbs. of rape-cake and 2 lbs. of bran for each cow. The moisture and flavor of the succulent roots permeate the dry food, inducing fermentation, with the development of sugar, and the mass thus becomes more palatable and digestible. Sometimes the mixture is steamed and given warm; and for milk cows in cold weather, one or two such messes given daily, usually pay for the cost and trouble of steaming. Of the mixture thus fermented or steamed, the cows should have as much as they can eat thrice a day. Cows in full milk, or intended to be speedily fattened, should have sprinkled over it a small quantity of bean or wheat meal, to the extent of 1 lb. or even 2lbs. daily. After each meal, give 3lbs. of good meadow-hay, and be careful never to allow of hay or anything else more than can be cleared up at once and with relish. In most parts, especially of England and west of Scotland, cabbage and green rape form the best succulent food for the first two winter-months; turnips and Swedes for the next two; whilst mangolds should serve until the grass is abundant in spring; but it should ever be borne in mind, that animals thrive best on varied and frequently changed food. A few feeds of mangolds, when the Swedes are the staple root, and *vice versa*, besides being a pleasing variety, will be found to augment the quantity of the milk. Rape-cake answers for milk cows quite as well as the more expensive linseed-cake, especially when its bitter taste is got rid of, as already advised, by fermenting or steaming. The increased produce, improved condition, of the cows, and the enhanced value of the manure, amply repay the trouble and the cost of this higher system of feeding, which amounts to from 1*s*. 6*d*. to 1*s*. 9*d*. per head daily.

The summer-feeding of cows is more natural and less expensive than the winter. In the English dairy counties, they are grazed upon the old pastures which are for this purpose preferred to those more recently laid down; whilst in Scotland they are often pastured upon the clovers. They should never have to work hard for their meals, and should further receive in the house, when brought in for milking, cut clover and rye-grass. Unless in the case of very fine and rich pastures, an allowance of rape-cake is also advisable. Such management not only improves the yield and quality of the milk, but supports the cows in high condition, and maintains the pastures in high and increasing fertility. This last matter is worthy of consideration, for under the older system, many of the once famed dairy farms of Cheshire, and other counties rapidly declined in value. The tons of butter and cheese carried away from the soil left it poor and unprofitable. In such circumstances, the use of bones and other such manures, by improving the condition of the soil, greatly improved the nutritive quality of the grass and hay. The produce of good land in high condition is always more valuable alike for dairy and for feeding purposes. A given acreage will support more animals, if the produce be cut and brought to them, than if they are permitted to depasture it. The advantages of both systems are, however, secured by running the cows at grass during part of the day, and giving them cut clover in the house during the remainder. Throughout the early and later part of the season, it is better that the animals be out during the day, and in at night; but in the intense heat of a warm summer, their being housed in the day secludes them from the attacks of troublesome flies, and permits their grazing undisturbed during the cool of the night. When cows run and jade themselves in the pastures during oppressive heat, their value as milkers is depreciated.

A good supply of water is necessary for milk-cows, which require much more than feeding stock. In winter, they should have access to it at least twice a day, and require it still oftener in summer. Adequate shelter, and comfortable and convenient buildings are very essential to successful management. Unless the housing is good and comfortable, the materials which ought to go to the formation of butter are wastefully spent in supporting animal heat. Cows in full milk are most profitably kept in well ventilated byres or hovels, of which the winter temperature should fall little below 60°.

The heifer may be put to the male when about two years old. The period of gestation is nine calendar months, or 284 days, but is usually shorter in young animals, and when the calf is a female. During pregnancy, cows fortunately are little liable to disease. Abortion occasionally occurs, and is most common about the third or fourth month. The heifer should receive the ordinary food of store-stock until within six or eight weeks of calving, when it is profitable to diet her as recommended for cows.

It is a great mistake to starve cows in calf. They should be fairly and carefully fed, and milking suspended entirely for about two months, or at least 6 weeks before calving. In older cows, especially if good milkers, for a fortnight before calving, the bowels must be kept relaxed, the teats drawn, and any milk removed several times a day, and an occasional dose of salts given. Such simple precautions will prevent that apoplectic form of milk-fever which destroys so many excellent milk-cows. The enlargement of the udder, and appearance of milk, the loosening of the ligaments of the pelvis, the relaxation of the vulva, and the animal's evident desire to be alone, betoken the approach of parturition. The act is generally accomplished speedily and easily, and without requiring much assistance. The calf usually comes with its forelegs first, and its head rather on one side, with the nose between the knees. The cow often stands, and as the calf drops, the navel string is ruptured. With a wisp of straw, the little animal is rubbed dry, and receives either from its mother, or from a bottle, a small quantity of the rich new milk popularly known as the 'beastings' or cherry-curds technically termed the Colostrum (q. v.). In this the caseine is mostly displaced by more easily digested albumen; whilst the large amount of sugar and oily matter promotes the clearing out of the bowels. In few cases of dairying are the calves allowed to suckle their dams. Many of the calves are sold young, to graziers and feeders; others are intended for veal, and are fed highly for a short time on good milk, meal, and cake; while some—a few of the female animals—are fostered and reared with a view to fill blanks in the cow ranks.

These latter get warm milk for five or six weeks, and skimmed for about as long, after which grass, early roots, and cake sustain them. For the first nine days, calves should be carefully muzzled to prevent them eating straw. They do not ruminate, until the ninth day is passed, and if before then they eat any straw, death generally ensues. The cow after calving should have a drink of meal and tepid water, to which a little salt may be added. For the first week steamed food, bran-mashes, with good hay, constitute the best food: roots at all times, and cold water during winter, are best withheld. Cleansing drinks are quite uncalled for; and if the placenta do not come away within twelve hours after calving, it may be very properly and safely removed by any one accustomed to such offices. After the lapse of a fortnight from the date of calving, roots may be given in considerable quantities, provided always the change has been accomplished gradually. Turnips touched by frost should be studiously avoided, to cows either before or after calving, especially before.

In England, milking is usually done by men, eight or ten cows being allotted to each, and the operation, except in the case of newly calved cows, is repeated only night and morning. In Scotland, the milking is generally done by women, three times a day; and more milk is thus got than by milking only twice. The removing of the whole of the milk at each operation is most essential; indeed, experienced dairymen aver that half their profit lies in carefully getting the last of the milk, which, as is well known, is much the richest. With liberal feeding, such as that above described, well-selected cows yield daily, in a fortnight or three weeks after calving, 12 to 16 quarts, and should continue to do so for six or eight months. Even with the same management, the milk of some cows is especially rich, and yields an unusually large proportion of butter; whilst others are equally remarkable for the way they fill the cheese-tub. A quart of ordinary milk yields about an ounce of butter; and more in summer than in winter; but under good feeding, the amount reaches and even exceeds an ounce and a half, and is tolerably equal at all seasons. A quart of new milk yields four ounces of curd; and each cow is estimated to produce 500 lbs. of cheese in the season. It is essential that the cows be kindly treated by those to whom their milking is intrusted; otherwise, the animals will retain the best of the milk. Some people approve of giving food to the cow during the milking process. This may secure a freer discharge of the milk, but it establishes a troublesome custom, which, once begun, must generally be carried out ere the cows allow their milk to flow; and in dairies not very systematically conducted, or small, the application of food at the milking hour is often inconvenient. On many farms, where dairying is not a special feature, much of the value of the cows is lost by imperfect and careless milking—the work of unscrupulous servants.

In the successful management of milk, butter, and cheese, much depends upon the dairy itself. It should have, if practicable, a northern exposure. Proximity to sewers, pig-sties, or any offensive smells, must be sedulously avoided. Stone and lime are the best materials. The walls may be advantageously lined with a skirting of brick, or, where the cost is not objected to, with white glazed tiles. A lofty roof and free ventilation must be provided, with windows looking north. A double door is advisable—a light sparred one placed inside, useful in summer for freely admitting plenty of air; and a solid, well-fitting, boarded one, removable in summer, and necessary for keeping out the winter cold. The temperature of the dairy may be further moderated, in hot weather, by allowing a stream of cold water to trickle slowly over the floor, or, better still, round the milk-vessels, placed in large vats, and by hanging throughout the room coarse calico saturated with water several times a day.

In winter, hot-water pipes, closed doors, windows protected by straw, and such other appliances, must be resorted to for the maintenance of the desirable temperature of from 50° to 56°. Further to insure an equable temperature, it is advisable to shelter the building with trees and shrubs, and, if possible, have it four or five feet below the level of the ground. No animal food, drying clothes, or indeed anything else, except milk, butter, and newly made cheese, should ever enter its walls. To remove any acidity or noxious emanations, charcoal-powder is sometimes kept strewn on the shelves. An annual whitewashing of roof and walls helps to cleanse and purify. Daily must the floor and shelves be thoroughly scrubbed and washed, and not a drop of spilled milk allowed to remain for many minutes unremoved. By far the neatest and best shelves are of stone or slate, two and a half feet wide, raised on stout iron rods about two feet from the bricked or paved floor. The dishes are best made of earthenware, or oak lined with lead. Where many cows are kept, these last may be conveniently made three feet wide, and four or five feet long. They will thus project six inches over the shelf, and should be provided with a brass plug, by which the milk, when skimmed, can be drawn off without moving the vessels. These, and the milk-buckets, and, indeed, every article, that comes in contact with milk or butter, must be kept scrupulously clean. Immediately after use, they should be rinsed out with cold water, and then with hot; wooden and metal articles well scoured with a scrubber, again washed, or, where practicable, dipped into a boiler amongst scalding water, and then set aside for several hours, to dry, air, and sweeten. For scrubbing purposes, a small tightly girded bunch of mountain heath, where such can be had, is best adapted, and failing it, a wisp of strong straw. These should be changed frequently. Indeed, the comparatively short period of their duration is a guarantee for that. Inattention to the proper cleaning and scouring of the dishes, especially in sultry weather, is sure to be marked by sour milk. Upon many farm homesteads in Scotland, loss is occasioned by the unsatisfactory condition in which the dairies are kept.

The milk, when brought into the dairy, is run through a wire-gauze or horse-hair strainer, into the vessels above described. To encourage the rapid rise of the cream, the layer of milk should be shallow, especially in summer. At the end of 12 or 24 hours, the cream is carefully removed; and in cool weather the milk may stand for another 12 or 24 hours, when it is again skimmed, the residue going to the pigs or calves. The cream removed at the first skimming is always richest and best; and where it is desired that the butter should be first-rate, any subsequent skimmings may be kept separate, and churned by themselves. Churning at short intervals of twice or thrice a week is preferable to allowing the cream to stand for a longer period.

Every time cream is added, the contents of the tank or cistern are well stirred, and a little salt added, unless, as in Scotland, where the butter is liked perfectly fresh. The cream should be kept as cool as possible, especially during the several hours preceding churning. For this end, in very hot weather, the cream-tank is sometimes lowered into a conveniently deep well, or placed for several hours in a water-cistern or under a running tap. In such weather, the churning, which generally occupies from 30 to 40 minutes, should be done at night, the butter laid in brine, and made up early next morning. When the whole milk is kept for churning, care must be taken never to add new milk to that which has already been sour. The establishment of large cheese factories, dairy factories, and dairy supply companies, first in the United States and afterwards in England, has promoted the invention of machinery for dairy purposes, and saves much manual labor both in the making of cheese (q. v.) and butter. The use of cream separators (usually Laval's) worked by a steam or gas engine, has quickened the process of butter-making immensely. Instead of standing in deep or shallow pans until the cream shall rise, by means of a centrifugal 'separator' the cream is removed from the fresh milk, and in a short time is made into butter by machinery in which all contact by hand is avoided. The manufacture and export of artificial butter, called butterine, and cheese made from clarified lard and a little milk (see OLEOMARGARINE), has been carried on to a great extent in the United States.

Much of the milk supply of London and other large towns is carried by rail from distances of 60, 80, or 100 miles, and is usually conveyed in steel cans, after having been passed through a refrigerator. The sale of the sweet-milk is found to pay better than the making either of butter or cheese. Quantity rather than quality of milk is usually the main requirement, and a liberal amount of soft succulent food is accordingly used. In large towns, the cow proprietors do not rear their own cows and often buy animals which they do not find it advisable to keep long. For the most part of the year they are necessarily stall-fed, the dietary consisting of cut grass, various sorts of early roots, and distillers' or brewers' draft and wash. The grass raised from town-sewage irrigation has latterly been given extensively to city dairymen's cows. It is worth noting that typhoid fever has been traced to infected milk, caused by cows drinking polluted water.

Statistics show that the United Kingdom is gradually becoming more dependent on foreign supplies of dairy produce. In 1856, 513,392 cwts. of butter were imported; and in 1880 the quantity had increased to 2,326,305 cwts. Cheese also shows a very great increase in the same period, the quantity imported in 1856 being 407,076 cwts., and in 1880, 1,775,997 cwts. To add to the significance of the statistics, the exports from Great Britain indicate a decrease. The butter exported in 1856 reached 139,548 cwts.; and in 1880, 31,408 cwts. Cheese exported in 1856, 39,545 cwts.; and in 1880, 11,903 cwts.

For further information, the reader is referred to the following works: *Dairy Farming*, by John C. Morton; *Dairy Management*, by J. Horsfall; *Dairy Management*, by Mrs. Scott; articles on Dairy Management in Morton's *Cyclopædia of Agriculture* (new ed. 1874); Stephens's *Book of the Farm; Dairy Farming*, by Rowland, edited by Ablett (1879).

DA'IS (Fr.). This term was used with considerable latitude by medieval writers. Its most usual significations are the following: 1. A canopy over an altar, shrine, font, throne, stall, chair, statue, or the like. The term was applied to the canopy without regard to the materials of which it was composed, which might be cloth,

wood, stone, metal, or other substance. 2. The chief seat at the high table in a hall, with the canopy which covered it, from which probably the word in all its significations was introduced, its French meaning being a canopy. 3. The high table itself. 4. The raised portion of the floor, or *estrade*, on which the high table stood, and by which the upper was divided from the lower portion of the hall; and 5. A cloth of state for covering a throne or table. In old writings, the word occasionally takes the form of *dois*, and more rarely that of *dez* or *detz*.

DAI'SY (*Bellis*), a genus of plants of the natural order *Compositæ*, sub-order *Corymbiferæ*.—The common D. (*B. perennis*), plentiful throughout Europe, flowers almost all the year in pastures, meadows, and grassy places. What are called double varieties, with flowers of various and often brilliant colors, are very commonly cultivated in gardens, the flowers consisting entirely of florets of the ray. A variety called the *Hen-and-chickens D.*, frequent in cottage-gardens, has the flower (head of flowers) surrounded by smaller ones, the short stems of which grow from the summit of the *scape* or leafless stem. The D. (*Gowan* of the Scotch) has long been a favorite with poets and lovers of nature, characteristic as it is of many of the fairest summer scenes, its blossoms gemming the pastures, and recommended also by its frequent appearance during the severer seasons of the year. Its flowers close at night. It is not found in America. A species of *Bellis* is, however, found in the United States (*B. integrifolia*), but it is confined to Tennessee, Arkansas, and the neighboring regions. Europe produces some species unknown in Britain, but of little interest; and species of the nearly allied genus *Bellium* are also found in the south of Europe. In the days of chivalry, the D. was the emblem of fidelity in love, and was frequently borne at tournaments both by knights and ladies.

DAISY, MICHAELMAS. See ASTER.

DAKO'TA, or DACO'TAH (so called from the Dacotah Indians or Dacoits—see SIOUX), a territory of the United States, bounded by Minnesota on the E., Nebraska on the S., Montana and Wyoming on the W., and the British possessions on the N. It was formerly part of the territory of Minnesota, but was detached when that became a state. D. is in length 414 miles, its average breadth is about 360 miles, and it has an area of 150,932 square miles.

The territory is watered by the Missouri and its branches. D. includes open grassy plains, high rolling prairies, and abounds in game furnishing valuable furs. The land is fertile and well timbered, and is rich in coal and other minerals. The N. Pacific Railway runs across D. from E. to W. The territory was organized in 1866; pop. (1870) 14,181; (1880) 135,180, without tribal Indians.

DALAI'-LA'MA. See LAMAISM.

DALAMOW, a city of Oude, on the left bank of the Ganges, in lat. 26° 4′ N., and long. 81° 7′ E. It is 68 miles above Allahabad. Pop. (1871) 5654, of whom only 250 are said to be Mohammedans. D. has long been regarded as a holy place in connection with its sacred river, having two antique temples of Siva on the margin of the stream, and an ancient ghat or stair for aiding the ritual ablutions of the pilgrims.

DALARADIA, the ancient name of a territory in Ireland which comprehended what is now the southern half of the county of Antrim, and the greater part of the county of Down. It was sometimes also called *Cric na Cruithne*, 'the region of the Picts,' from the Irish name of its inhabitants, otherwise called the Dal Araidhe, 'the race of Fiacha Araidhe,' a chief or prince of Ulster, who is said to have lived about 236 A.D. The name continued in use till the end of the 12th century. It must not be confounded with DALRIADA (q. v.).

DA'LBERG (formerly, DALBURG), the name of an ancient and noble German family, of which several members held, by hereditary right derived from the oldest times of the middle ages, the office of chamberlain to the archbishopric of Worms. So great was the renown of the D. family, that at every coronation of a German emperor the royal herald exclaimed: 'Is there no Dalberg here?' whereupon the representative of the family kneeled, and received from the new emperor the dignity of 'first knight of the empire.' Several members of this family have been celebrated as patrons of literature and art, of whom the most distinguished is

DALBERG, KARL THEODOR, BARON VON, Chamberlain of Worms and Archbishop of Regensburg, born at Hernsheim, February 8, 1744. He studied in Göttingen and Heidelberg, and, after some time passed in travel, devoted himself to the church. At Erfurt, of which he was appointed governor, 1772, he was active and generous as a patron of literature and art, and also contributed greatly to the social and commercial welfare of the little state placed under his control. After holding several high offices in the church, D. was sent to Paris (1804), in order to assist in adjusting several ecclesiastical affairs with Napoleon and Pope Pius VII. He died at Regensburg, February 10, 1817.

D. was as highly respected as a ruler and a scholar as for his private character. During his whole life, he cultivated the friendship of those eminent in literature and art, such as Goethe, Schiller, Wieland, &c. His writings—marked by sound learning and eloquence of style—include a treatise *On the Influence of the Arts and Sciences on Social Order* (1793), and *Pericles, or the Influence of the Fine Arts on the Public Welfare* (1806). These were his favorite objects of study; but natural history, chemistry, botany, mineralogy, and agriculture, also engaged his attention.

DALBE'RGIA, a genus of trees and climbing shrubs of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, having a stalked membraneous pod, which is flat, tapers to both ends, and contains 1—3 flat seeds. The leaves are pinnate, with a terminal leaflet. All the species are natives of warm climates. Some of them are valuable timber trees, particularly the SISSOO of Bengal (*D. Sissoo*), much prized, and more extensively used in the north of India than any other timber-tree except the Sal (q. v.). *D. monetaria*, a native of Surinam, yields a resin very similar to Dragon's Blood.

DALECA'RLIA, or DALARNÉ (signifying 'valley-country'), an old province of Sweden, now forming the län or county of Fahlun or Falun (q. v.). The Dalecarlians are celebrated for the part they took under Gustavus Vasa in freeing their country from the yoke of Christian II. of Denmark.

DALGA'RNO, GEORGE, an almost forgotten but very able author, was born at Aberdeen about 1626, studied at Marischal College, and afterwards kept a school in Oxford for 30 years, where he died August 28, 1687. He deserves to be remembered for two remarkable works—the *Ars Signorum, Vulgo Character Universalis et Lingua Philosophica* (Lond. 1661); and *Didascalocophus, or the Deaf and Dumb Man's Tutor* (Oxf. 1680). The former is a very ingenious attempt to represent and classify ideas by specific arbitrary characters irrespective of words. It contains the germs of Bishop Wilkins's subsequent speculations on a 'real character and a philosophical language.' Leibnitz has repeatedly alluded to it in complimentary terms. The latter work has for its design, 'to bring the way of teaching a deaf man to read and write, as near as possible to that of teaching young ones to speak and understand their mother-tongue.' D. has the great merit of having anticipated, by more than 130 years, some of the most profound conclusions of the present age respecting the education of the deaf and dumb.

DALHOU'SIE, MARQUIS OF, JAMES ANDREW BROUN-RAMSAY, Governor-general of India, third son of the ninth Earl of D. was born April 12, 1812, at Dalhousie Castle, Midlothian. He was educated at Harrow, and graduated at Christ Church, Oxford. In 1832, by the death of his only remaining brother, he succeeded to the honorary title of Lord Ramsay. In 1835, he contested the representation of Edinburgh, in the Conservative interest, against the Whig candidates, Sir John Campbell, afterwards Lord Campbell, and Mr. Abercromby.

He bore his defeat with great good-humor. In 1836, he married the eldest daughter of the eighth Marquis of Tweeddale; in 1837, was elected for Haddingtonshire. On the death of his father, in 1838, he succeeded to the earldom of D., and became a member of the Upper House. In 1843, he was appointed, by Sir Robert Peel, Vice-president of the Board of Trade, and in 1845 succeeded Mr. Gladstone as President of the Board. The 'railway mania' threw an immense amount of labor and responsibility upon his department; but the energy, industry, and administrative ability he displayed in his office, no less than his readiness and fluency in parliament, marked him out for the highest offices in the state. When Sir Robert Peel resigned office in 1846, Lord John Russell, who succeeded him, paid the Earl of D. the rare compliment of asking him to remain at the Board of Trade, in order to carry out the regulations he had framed for railway legislation and intercommunication. In 1847, he was appointed Governor-general of India, as successor to Lord Hardinge, and arrived in Calcutta, January 12, 1848—the youngest governor-general ever sent to that country. His Indian administration was not less splendid and successful, in regard to the acquisition of territory, than in the means he adopted for developing the resources of the country and improving the administration of the East Indian government. Pegu and the Punjab were conquered; Nagpore, Oude, Sattara, Jhansi, and Berar were annexed—altogether, four great kingdoms, besides a number of minor principalities, were added to the dominions of the Queen under his governor-generalship. Railways on a colossal scale were planned, and partly commenced; 4000 miles of electric telegraph were spread over India; 2000 miles of road between Calcutta and Peshawur were bridged and metalled; the Ganges Canal, the largest of the kind in the world, was opened; the Punjab Canal was undertaken; important works of irrigation all over India were planned and executed; and the official department of public works was re-organized. Among other incidents of his beneficent administration may be cited the permission to Hindu widows to marry again; relief to persons of all sects from

the risk of forfeiting property by a change of religion; the improvement of education and of prison-discipline; the organization of the Legislative Council; the improved training of the civil service, covenanted and uncovenanted; and the reform in the postal service of India, whereby a letter from Peshawur to Cape Comorin, or from Assam to Kurrachee, is now conveyed for three-farthings, or $\frac{1}{15}$th of the old charge. These, and many other achievements of his Indian administration, will be found in a minute which he drew up on resigning office, in which he reviewed, with pardonable pride, the events of his eight years' governor-generalship. His constitution had never been strong, and it gave way under the incessant labor and responsibility imposed upon him by his noble ambition.

Meanwhile, honors had been showered upon him by his queen and country with no sparing hand: in 1848, he was made a Knight of the Scottish order of the Thistle; in 1849, he received the marquisate, the thanks of both Houses of Parliament and of the East India Company, for the 'zeal and ability' displayed in administering the resources of British India in the contest with the Sikhs, immediately previous to the annexation of the Punjab; in 1852, on the death of the Duke of Wellington, he was nominated by the then prime minister, the Earl of Derby, to the office of Constable of her Majesty's Castle of Dover, and Lord Warden of the Cinque Ports. D. sailed from Calcutta in March 1856. On his arrival in England, he was unable to take his seat in the House of Lords; and the remainder of his days was spent in much physical suffering and prostration of strength. On the 19th December 1860, he died at Dalhousie Castle in his 48th year, leaving behind him a name that ranks among the highest in the roll of Indian viceroys for statesmanship, administrative vigor, and the faculty of inspiring confidence among the millions subjected to his sway. As he died without male issue, his title of marquis became extinct on his death, the earldom of D. and other Scottish honors reverting to his cousin, Baron Panmure, who died in 1875.

DA'LIAS, a town of Spain, situated in the province of Almeria, 20 miles west-south-west of the city of that name, and about 4 miles from the Mediterranean. It is badly and irregularly built, and is subject to earthquakes. Pop. 9000, who are employed chiefly in mining, smelting, and fishing.

DA'LIAS, a town of Spain, 17 miles west-south-west of Almeria. Near are lead and antimony mines. Pop. 9360.

DALKEI'TH, a burgh of barony, 6 miles south-east of Edinburgh, stands near the junction of the North and South Esk, and is a station of the North British Railway. It chiefly consists of one main street. Pop. (1881) 6931. It has one of the largest corn-markets in Scotland; has a large and commodious market-hall, erected in 1854; manufactures of brushes, woollens, and hats, besides iron-foundries, tanneries, and coal-works. D. arose round an ancient castle, which was long a great stronghold. The regality of D. was successively held by the Grahams, the Douglases, the Earls of Morton, and the Earls of Buccleuch—the latter having bought it from the Mortons in 1642. During the minority of James VI., D. Castle was the chief residence of the Regent Morton; hence it was called the Lion's Den. General Monk lived in it during his government of Scotland under Cromwell. Dalkeith Palace, the chief seat of the Duke of Buccleuch and Queensberry, built about 1700 on the site of the old castle, is a large square structure overhanging the North Esk, amid fine grounds, in which the two Esks flow and unite. There are about a dozen places of public worship.

Besides the old parish church there is another, a fine cruciform structure in the early English style, built (1840) and endowed by the Duke of Buccleuch. An Episcopal Chapel stands within the palace grounds. D. possesses several good public and private schools. The Dalkeith union workhouse, opened in 1849, was the first of such houses in Scotland. The town has much improved during the last thirty years, and is becoming gradually more extensive.

DALKISSO'RE, a river of Bengal Proper, joins the Hoogly from the right at Diamond Harbor, about 30 miles below Calcutta. It has a south-east course of about 170 miles, rising in lat. 23° 30′ N., and long. 86° 34′ E. In its lower section the D. assumes the name of the Roopnerain. The Channel of the Hoogly which receives the Roopnerain, has of late years become silted up through the same cause to which the adjacent delta owes its existence, so as to be now frequented only by native craft. Nor does it, on other grounds, afford a desirable passage upwards, for as the tide sets strongly into the Roopnerain, as offering less resistance to its progress, many vessels bound to Calcutta have been swept up the shallow estuary, and lost.

DA'LLAS, GEORGE MIFFLIN, an American statesman and diplomatist, was born at Philadelphia, July 10, 1792. He was educated at Princeton College, where he graduated with high honors in 1810. Soon after he was called to the American bar, he accompanied Mr. Gallatin in his special embassy to St. Petersburg as private secretary. On his return, he resumed the practice of the law, and successively filled the offices of deputy of the attorney-general of Philadelphia, mayor of Philadelphia, and district-attorney of Philadelphia, an office which his father had held. In 1831, he represented Pennsylvania in the Senate of the United States, but after two years retired, and resumed his profession. In 1837, he was appointed American minister at St. Petersburg, but was recalled in 1839. In 1844, he was elected vice-president of the United States, and held this office until 1849. In 1856, he succeeded Mr. Buchanan as American minister at the court of St. James's. He was empowered to settle the Central American question; but shortly after his arrival, a dispute between the two governments, arising out of the dismissal of Mr. Crampton, the British minister at Washington, by the president of the United States, threatened to bring the diplomatic mission of D. to a premature termination. Through the forbearance of Lord Palmerston, he was, however, permitted to remain, and discharged the duties of American minister until 1861, when he was succeeded by Mr. C. F. Adams. In person, he was tall, and of venerable aspect. He diligently studied the politics and institutions of the mother-country, and during his embassy assiduously attended the debates in both Houses of Parliament. He died in 1864.

DALLES, romantic and perilous rapids on the Columbia or Oregon, form, along with the Chutes above them, and the Cascades below them, an almost continuous interruption between the tide-water of the river and its long reach—about 400 miles—of comparatively practicable navigation towards the interior. They are subdivided, reckoning downwards, into the Little D. and the D. Proper. On the latter, the basaltic rocks, which, from a considerable distance above, bound the channel, suddenly confine the stream to one-third of its width, with a perpendicular wall on either side; while the damming up of the plunging surges fearfully aggravates the difficulties and dangers of the descent.

DALMA'TIA, a narrow strip of territory, extending along the Adriatic Sea, and bounded on the N. by Croatia, on the E. by Bosnia, Herzegovina, and Montenegro. Lat. 42° 15′—44° 54′ N., long., 14° 30′—19° E. It forms, with its adjacent islands, the most southern crownland of the Austrian empire. Area, 4881 square miles; pop. (1869) 456,961. The coast of D. is everywhere steep and rocky, and the adjacent series of islands, divided by picturesque straits and channels, are of a like character. Numerous bays intersecting the coast form excellent havens and landing-places. Offsets from the Dinaric Alps traverse the interior, and attain in Mount Orien, the highest culminating point, an elevation of 6332 feet; the Velebich Mountains, separating D. from Croatia, and which belong to the Julian Alps, have a height of more than 5000 feet. The mountains of D., for the most part composed of limestone, present a bleak and barren aspect, with many romantic chasms and fissures, through which dash impetuous mountain-streams. The chief rivers—none of which, however, are of any importance—are the Zermagna, Kerka, Cettina, and Narenta, the second and third of which are broken in several places by beautiful cascades and falls. The lakes are numerous, but with the exception of Lake Vrana—which is separated from the Adriatic by only a narrow tongue of land, and the waters of which are brackish—they are periodical, drying up in summer, and filling their beds in late autumn. A large part of the whole area of D. consists of moor and morass, yet in summer there is often a great scarcity of water. The climate is in general warmer than that of any other part of Austria, the African sirocco being occasionally felt on its shores. The minerals are limestone, coal, gypsum, &c. Agriculture is in a backward state. About one-ninth of the land is arable, and produces wheat, barley, oats, maize, rye, and potatoes. Wine and olives are also produced. More than half the land is pasture, and wood occupies about a fifth. The islands are not very fertile, but supply good timber for ship-building.

Cattle-rearing, sea-faring, and the fisheries on the coast, are the chief kinds of industry. The live-stock in 1872 consisted of 673,600 sheep, 280,650 goats, 6000 mules, 16,000 asses, 17,000 horses, and 26,300 pigs. The annual value of the exports and imports is £1,500,000. The exports consist principally of wine, oil, brandy, hides, wool, wax, honey and fruits. Of the whole population it is computed that about 55,000 are Italians, 1000 Albanians, 1000 Germans, 500 Jews, and the remainder consists of Southern Slavonians—chiefly Dalmatians and Morlaks. The Dalmatians are a fine race of men—bold and brave as seamen and soldiers—and formerly were the main support of the military power of Venice. But it must be added that they are deceitful and rapacious, while the love of independence is extreme. They speak the Illyrian-Servian or Herzegovinian dialect; but the language used in the government offices, especially in Spalatro, is the Italian. The Morlaks—who inhabit the interior, the mountainous districts, and the Turkish sanjak of Hersek—are also good soldiers, hospitable and faithful to their engagements, lovers of independence, but it is said they are addicted to robbery and drunkenness. D. is divided into four circles—Zara, Spalatro (or Spalato), Ragusa, and Cattaro. These are also the names of the chief towns.

In ancient times, D. was a considerable kingdom, and after many unsuccessful attempts, was first subjugated by the Romans in the time of Augustus. After the fall of the Western Empire, D., which had formed the most southern part of the province Illyricum, was captured by the Goths, from whom it was taken by the Avari (490), who in their turn yielded it to the Slavonians about 620. The state founded by the Slavonians continued until the beginning of the 11th c., when King Ladislaus of Hungary incorporated a part of D. with Croatia, while the other part, with the title of Duchy, placed itself under the protection of the Venetian republic. The Turks afterwards made themselves masters of a small portion; and by the peace of Campo-Fornio (1797), the Venetian part of D., with Venice itself, became subject to Austrian rule; and when Austria, in 1805, had ceded this part of D. to Napoleon, it was annexed to the kingdom of Italy; afterwards (1810) to Illyria. Since 1814, D. forms part of Austria; the commune of Spizza being added by the Congress of Berlin in 1878.

DALMA'TIC (*Dalmatica*), the deacon's robe in the Roman Catholic Church. The most ancient form of the D. is exhibited in the annexed wood-cut, after an early Christian painting on the walls of catacombs at Rom . It was originally of linen, but it is now generally made of the same heavy silk as the Planeta (q. v.) worn by the priest.

DALRI'ADA, the ancient name of a territory in Ireland, comprehending what is now called 'the Route,' or the northern half of the county of Antrim. It signifies primarily, 'the race of Riada;' and secondarily, 'the country of the race of Riada,' i. e., Cairbre Righfada, or 'Cairbre of the Long Arm,' the son of a chief or prince of the Scots in Ireland, and himself a warrior of note. He lived in the 3d c., and not only obtained an ascendency in the district of Ireland which came to be called after him, but, according to some writers, planted a colony of his Scottish countrymen on the shores of Argyleshire in Alba, or Albany, as Scotland was then called. It is certain that about 506 A.D. some of his descendants, led by Loarn, Fergus, and other sons of Eirc, son of Muinreamhar, passed over to Argyleshire, where they settled themselves permanently, and founded the kingdom of 'Dalriada in Albany,' or 'the Scots in Britain.' More than twenty kings of this state are enumerated before Kenneth MacAlpin, who, about 843, united under one sceptre the Dalriads, or Scots, and the Picts, and thus became the first king of Albany, which about two centuries afterwards began to be known as Scotia or Scotland.

DALRI'ADS, or DALREUDI'NI, the inhabitants of DALRIADA (q. v.).

DALRY', a town of Ayrshire, Scotland, on the Garnock, 20 miles south-west of Glasgow. D. was recently a small village, but has of late rapidly increased in population and importance in consequence of the establishment of iron-works at and near it. D. possesses also a large woollen mill. Pop. (1851) 2706; (1861) 4232; (1871) 5214; (1881) 5010.

DALRY'MPLE FAMILY, a very old and illustrious Scottish family, deriving its name from the lands of Dalrymple in Ayrshire. The principal members are:

DALRYMPLE, JAMES, VISCOUNT STAIR, a lawyer and statesman, son of a small proprietor in Ayrshire, was born at Drummurchie, in the same county, May 1619, educated at Glasgow University, and at an early age, entered the army raised in Scotland to repel the religious innovations of Charles I. But the bent of his mind lay towards civil and literary pursuits; and in 1641, he was appointed professor of philosophy at Glasgow. The use which he made of philosophy, however, was rather to aid him in basing law—his favorite study—on profound and comprehensive principles, than to add another metaphysical system to those already in existence. In short, his wish was to be a philosophic lawyer, rather than a philosopher. In 1648, he entered as an advocate at the Scotch bar, where he rapidly acquired great distinction; in 1649, and again in 1650, he was appointed secretary to the commissioners sent to Holland by the Scottish parliament to treat with Charles II.; and in 1657, was induced—but with difficulty—to become one of the 'commissioners for the administration of justice' in Scotland under Cromwell's government.

Dalrymple was a conscientious, but at the same time an exceedingly moderate and enlightened royalist; and although appointed one of the new Scotch judges after the Restoration, he resigned his seat in 1663, because he could not take the 'Declaration' oath, which denied the right of the nation to take up arms against the king. His great talents, however, induced the monarch to accept his services on his own terms. Dalrymple was now created a baronet. In 1671, he became Lord President of the Court of Session. As a member of the Privy Council, he was invariably the advocate, though not always successfully, of moderate measures. In 1681, when the infamous 'test' oath was under consideration, Dalrymple, with the dexterity of a lawyer, caused John Knox's Confession of Faith to be introduced as a part of the test; but as this Confession inculcated resistance to tyranny as a duty, the one half of the test contradicted the other. Dalrymple's private conscience, however, was more fastidious than his public one, for he himself refused to take the very oath which, by his ingenuity, he had virtually deprived of its despotic character, and in consequence had to resign all his appointments. Before this, he had published the *Institutions of the Law of Scotland*, which is still the grand textbook of the Scotch lawyer. The disquisitions are both profound and luminous, characterized alike by their philosophic insight and their sound common sense. After some time spent on his estate in Wigtonshire, Dalrymple went to Holland in 1682, to escape the persecution to which he was subjected at home. During 1684—1687, he published at Edinburgh—though he himself was then residing at Leyden—his *Decisions;* and in 1686, at Leyden, a philosophic work in Latin, entitled *Physiologia Nova Experimentalis*. He accompanied the Prince of Orange on his expedition to England. When matters were prosperously settled, William re-appointed him Lord President of the Court of Session, and elevated him to the peerage under the title of Viscount Stair. He died 25th November 1695.

JOHN DALRYMPLE, eldest son of the preceding, held office under James II., and also under William III. While Secretary of State for Scotland, he incurred great odium on account of his share in the barbarous transaction known as the 'Massacre of Glencoe.' In 1703, he was elevated to the earldom of Stair. He died in 1707. —SIR JAMES DALRYMPLE, second son of Viscount Stair, was the author of *Collections concerning Scottish History preceding the Death of David I.* (1705), and the grand father of Sir John Dalrymple of Cranstoun, author of *Memoirs of Great Britain and Ireland, from the Dissolution of the last Parliament of Charles II. until the Seabattle off La Hogue*.—The other sons—Viscount Stair had altogether nine children, five sons and four daughters—were more or less distinguished.

DALRYMPLE, JOHN, second Earl of Stair, second son of the first Earl of Stair, and grandson of Viscount Stair, was born at Edinburgh, July 20th, 1673. He had the misfortune, while young, to kill his elder brother, by the accidental discharge of a pistol. This unhappy circumstance induced the parents, both for their own comfort and that of the boy himself, to educate him away from home. He was placed under the care of a clergyman in Ayrshire, who, by his prudence and kindness, soon developed the excellent qualities of the youth. Dalrymple afterwards went to Leyden, where he had the reputation of being one of the best scholars in the university. He completed his curriculum at Edinburgh. In 1701, he accepted a commission as lieutenant-colonel of the Scottish regiment of foot-guards, and gained the highest distinction in Marlborough's campaigns. When the accession of the Tory ministry, in 1711, put a stop to the brilliant career of the great duke, Dalrymple retired from the army. When George I. succeeded to the throne, Dalrymple—who had become Earl of Stair by the death of his father in 1707—was made a lord of the bedchamber, a privy-councillor, and commander-in-chief of the forces of Scotland. Next year, he was sent as ambassador to France, in which capacity he exhibited the highest ability, and was of the greatest service in traversing the schemes for the reinstatement of the Pretender; but as he refused to flatter his countryman, Law—notorious in connection with the fatal Mississippi scheme—who was then omnipotent in France, the government was mean enough to recall him. For 22 years he lived in retirement at Newliston, near Edinburgh, devoting himself chiefly to agriculture, which was then beginning to improve in Scotland. He was the first to plant turnips and cabbages in the open fields. In 1742, he was sent as ambassador to Holland, and in the following year served under George II., at the battle of Dettingen. Later, he was made commander-in-chief of the forces of Great Britain. He died in 1747. See *Annals, &c. of the Viscount and Earls of Stair*, by S. M. Graham (1875).

DALRYMPLE, SIR DAVID, a Scottish judge and historical antiquary, commonly known as Lord Hailes, was born at Edinburgh, 28th October 1726. He was the grandson of Sir David Dalrymple, youngest and reputedly the ablest son of Viscount Stair. He was educated first at Eton, afterwards at Edinburgh, and finally at Leyden, whence he returned to Scotland in 1746. In 1748, he was called to the Scottish bar, where his success was highly respectable, but not astonishing. Dalrymple was a man of extensive culture and classical tastes, of sound judgment and

great industry, but a very indifferent orator; and, in consequence, men of far inferior powers often acquired a greater reputation and a more lucrative practice. In 1766, he was appointed one of the judges of the Court of Session, and assumed the title of Lord Hailes, by which he is chiefly known to posterity, His accuracy, diligence, judicial impartiality, and dignified demeanor, secured him the highest respect in his new office. Ten years after, he was made a justiciary lord.

He died 29th November 1792.—Although Dalrymple's official duties were very arduous, he found time to compose numerous works, surpassing in value those of many men whose lives have been wholly devoted to literature. We can afford to mention only a few: *A Discourse on the Gowrie Conspiracy* (1757); *Memorials and Letters relating to the History of Britain in the Reign of James I.* (1762), a curious and interesting volume; *The Works of the ever-memorable John Hailes of Eton, &c.* (1765); *Memorials and Letters relating to the History of Britain in the Reign of Charles I.* (1766); *Annals of Scotland from the Accession of Malcolm III., surnamed Canmore, to the Accession of Robert I.* (1766); and *Annals of Scotland from the Accession of Robert I., surnamed the Bruce, to the Accession of the House of Stuart* (1779). Besides these, Dalrymple wrote works on legal antiquities and ancient church history, edited old Scotch poems, and published sketches of the lives of various notable Scotchmen, as specimens of how a *Biographia Scotica* might be executed.

DALRYMPLE, ALEXANDER, F.R.S., F.S.A, younger brother of the preceding, was born at New Hailes, the seat of his father, near Edinburgh, 24th July 1737. In 1752, he obtained an appointment in the East India Company's service; but his extreme youth, as well as the imperfect education he had received at home, rendered it necessary, on his reaching Madras, that he should be placed under the store-keeper for a time. Lord Pigot himself, at that time governor of the presidency, condescended to give him lessons in writing; but young Dalrymple having, unluckily for his own prospects, fallen upon some papers in the secretary's office relating to the commerce of the Eastern Archipelago, became so engrossed with the importance of the subject, that after some bickerings with his superiors, he relinquished his appointment, and made a voyage of observation among the eastern islands. At Sooloo, in the course of his expedition, he concluded a commercial treaty with the sultan, which might have led to beneficial results; but on his return in 1762, he found political affairs entirely changed, small-pox raging, and most of his influential friends dead. The scheme, in consequence, proved a failure. In 1765, he returned to Britain, to urge its importance on the home-authorities, but did not succeed. In 1775, however, he was sent out to Madras as a member of council, but was recalled in two years, apparently without good reason, for in 1779 he was appointed hydrographer to the East India Company, and shortly after received a pension. In 1795, when the Admiralty resolved to establish a similar office, it was conferred on Dalrymple, who held it till within a short period of his death, which occurred 19th June 1808, at Marylebone, London. Dalrymple wrote a vast number of letters, pamphlets, &c., containing plans for the promotion of British commerce in various parts of the world, political dissertations, accounts of geographical expeditions, &c. His library was rich in works of navigation and geography, all of which were purchased by the Admiralty. His collection of poetry, also very valuable, was deposited in the library at New Hailes, as a family heirloom.

DA'LTON, JOHN, was born September 5, 1766, at Eaglesfield, near Cockermouth, in Cumberland. He received his early education in the school of his native place, and, after 1781, in a boarding-school kept by a relative in Kendal. Here his love of mathematical and physical studies was first developed. He wrote several mathematical essays, and, in 1788, commenced a journal of meteorological observations, which he continued throughout his whole life. In 1793, he was appointed teacher of mathematics and the physical sciences in the New College at Manchester, where he resided chiefly during the remainder of his life, though frequently employed, after 1804, in giving lectures on chemistry in several large towns. In the years 1808—1810, he published his *New System of Chemical Philosophy*, 2 parts (Lond.), to which he added a third part in 1827. In 1817 he was appointed president of the Literary and Philosophical Society at Manchester. He was also a member of the Royal Society, and of the Paris Academy, and, in 1833, received a pension of £150, afterwards raised to £300. In the same year, D.'s friends and fellow-townsmen collected £2000, to raise a statue to his honor, which was executed by Chantrey, and placed at the entrance of the Royal Institution in Manchester. D. was also honored by the university of Oxford with the degree of D.C.L., and with that of LL.D. by the university of Edinburgh. He died, universally respected, at Manchester, July 27, 1844. His chief physical researches were those on the constitution of mixed gases, on the force of steam, on the elasticity of vapors, and on the expansion of gases by heat. In chemistry, he distinguished himself by his progressive development of the Atomic Theory (q. v.), as also by his researches on the absorption of gases by water, on carbonic acid, carburetted hydrogen, &c. His treatises are mostly contained in the *Memoirs of the Literary and Philosophical Society of Manchester*, the *Philosophical Transactions*, Nicholson's *Philosophical Journal*, and Thomson's *Annals of Philosophy*. Besides these, we have his *Meteorological Essays and Observations*. (Lond. 1793; 2d edit. 1834). D. was unquestionably one of the greatest chemists that any country has produced. Profound, patient, and intuitive, he had precisely the faculties requisite for a great scientific discoverer. His atomic theory elevated chemistry into a science. In his habits, D. was simple; in his manners, grave and reserved, but kindly, and distinguished by his truthfulness and integrity of character.

DA'LTON, a town of Furness, Lancashire, and 18 miles west-north-west of Lancaster. There are iron mines and foundries in the vicinity. Pop. (1881) 13,350.

DA'MAGES, in Law, are the pecuniary recompense claimed on account of suffering an injury through the act of another. The peculiar constitution of the English common-law courts, which, till lately, prevented them in most cases from giving any other remedy than by way of D., rendered the questions relating to this subject of unusual importance; but the progress of recent legislation has been in the direction of restricting actions for D. to the cases in which the restitution of property or enforcement of a right cannot be otherwise attained. The Court of Chancery, on the other hand, could not give D., it could only enforce performance of an obligation by personal restraint, and hence, according to the nature of the remedy desired, the suitor resorted to the one or other court. In Scotland, the supreme court has always been able to give redress in either way.

Where a sum ascertained in amount is due, the action is one not properly for D., but of debt. But where the sum is not ascertained, as where an injury has been done to a man's character or property, the action in either country can in general only be for D., the amount of which the injured party estimates, and which is determined by the judgment of the court, or verdict of a jury, subject to certain fixed rules which the courts have laid down, as the principle according to which the estimation is to be made. These, it is obviously impossible to detail here, and reference must be made to the title of the special subjects out of which a claim may arise for such information as it is practicable to give. It may be observed, however, that it is a general rule to restrict the amount of D. to that of the actual pecuniary loss, wherever it can be ascertained; and that neither in Scotland nor England will a stipulated penalty for breach of agreement be accepted as determining the sum due for D., unless it shall appear, by the use of the term 'as liquidated damages,' or some equivalent expression, that both the parties had intended to fix conclusively the sum payable in case of default. Other general rules are, that the injury for which D. are claimed must have affected the claimant individually, and not merely as one of the general public, although it is not essential that the injury should have done material hurt to him, as this only affects the amount of damages. And the injury suffered must have been the direct and immediate consequence of the act done; if it has only been a secondary or remote result of the act, no D. will be given. And any act sued on must be an actual injustice; it is not enough that it produces disadvantageous results, if these arise only from doing what the party was justified in doing. D., therefore may be sued for in respect of a crime involving liability to criminal punishment; but in England, in the case of a felony, no action for D. will lie against the offender, because it is the duty of the complainant to prosecute him criminally. It is otherwise, however, in the case of misdemeanors; an action for D. is there independent of criminal proceedings. In Scotland, this is the rule in reference to every species of crime.

DAMA'N, a seaport town, province of Guzerat, Hindustan, belonging to the Portuguese. It stands at the mouth of the Daman Gunga, or Daman River, which rises in the Syadree Mountains, as the upper extremity of the Western Ghauts is called by the natives, in lat. 20° 11′ N., and long. 73° 42′ E. Common spring-tides give at least three fathoms on the bar, while outside is a roadstead of more than double that depth. The harbor affords good shelter from the south-west monsoon, and, as the neighborhood is well-stocked with suitable timber, the people are largely employed in the building and repairing of ships. The peculiar drawback of the locality is the scarcity, or rather the want, of fresh-water. The river, even when swollen by the rains into an inundation, is brackish, and the wells likewise are so in some degree. Endemic fevers are the natural consequence. The place is fortified with a rampart and bastions, and it is described as having been, before the arrival of the whites, 'a town great and strong.' Pop. 6000.

DAMAN, an outlying portion of the Punjab, runs about 300 miles along the right or west bank of the Indus, extending back,

with an average breadth of about 60 miles, as far as the Suliman Mountains. It stretches in N. lat. from 28° 40′ to 33° 20′, and in E. long. from 69° 30′ to 71° 20′. In the absence of irrigation, the district in general is little better than a plain of smooth, bare, hard clay—the result of alternate inundation and evaporation. But when duly irrigated, this baked and burned surface becomes very productive, more especially in the strip of land—known as the Derajat—which is nearest to the bordering stream.

DA'MAN (*Hyrax*), the name of one or more species of the order *Hyracoidea*, established by Huxley, and containing 13 species. They were long regarded as a link between *Rodentia* and *Pachydermata*. They were always ranked among the former, till Cuvier pointed out their essential agreement, in dentition and anatomical characters, with the latter, and assigned them a place next to the elephant and rhinoceros, remarking, that 'excepting the horns, they are little else than rhinoceroses in miniature.' He adds that 'they have quite similar molars, but the upper jaw has two stout incisors curved downwards, and during youth, two very small canines, the lower jaw four incisors without any canines.' The skull, also, and other bones of the head, resemble those of the pachyderms. The muzzle is short; the ears, short and round. The ribs are more numerous than even in the pachyderms—21 pair, a number exceeded in no quadrupeds except the sloths, whereas no rodent has more than 15 pair. The toes are united by the skin to the very nail, as in the elephant and rhinoceros, and are round and soft, merely protected in front by a broad nail, which does not reach the ground. The legs are short. The tail is a mere tubercle. There are several species of this genus, natives of Africa and of the south-west of Asia.

The SYRIAN D. (*H. Syriacus*) is now generally believed to be the *shaphan* of the Old Testament, the *Cony* (q. v.) of the authorized English version, an illustration of which will be found under article CONY. The D. is common in Syria and Palestine, inhabiting rocky places, and sheltering itself in the holes of the rocks, but not burrowing, for which its feet are not adapted. It is a timid harmless creature, quick and lively in its movements, completely herbivorous, easily domesticated, and, in confinement, readily eating bread, roots, fruits, and herbs. It is about eleven inches long, and ten inches high; brownish-gray above, white beneath, the thick hair interspersed with long scattered bristles. The ASHKOKO (*H. Abyssinicus*) of Abyssinia, first described by Bruce, and supposed by him to be the shaphan, is now believed to be distinct from the Syrian D., although very similar. The KLIP-DASSE (*H. capensis*) of South America differs from the shaphan in its darker color and rather larger size, and also in having only three toes on each foot, whereas the Syrian D. has four toes on the fore-feet and three on the hind-feet. It is very common in rocky places in South Africa, both on the hills and near the seashore. Its favorite food consists of aromatic plants, and its flesh, although eatable, is highly flavored. In the places which it frequents, a peculiar substance called *Hyraceum* (q. v.) is found—an animal secretion, to which medicinal virtues are ascribed, but the nature and origin of which have not yet been thoroughly ascertained.

DAMA'R, a town of Yemen, Arabia, pleasantly situated on an elevation about 120 miles north-north-west of Aden. It has about 5000 houses, is the residence of a governor, and has a college, attended by several hundred students.

DAMASCE'NUS, JOANNES, the author of the standard textbook of Dogmatic Theology in the Greek Church, was born at Damascus about 700 A.D. On account of his eloquence, he was surnamed *Chrysorrhoas* ('Golden Stream'). In 730. he became a monk in the convent of St. Saba at Jerusalem, where he spent the rest of his days in the composition of theological works. He died about 756 A.D., and had the honor of being canonized by both the Latin and Greek churches. D. was a man of extensive erudition, and was considered the ablest philosopher of his time; but the word 'philosopher' must have meant something very different in those days from what it does now, as D.'s writings are characterized by weakness of judgment and want of critical power. The best edition is that of Le Quien (2 vols., Paris, 1712).

DAMA'SCUS (Arabic, *Dimishkesh-Shâm*), a city of Syria, the largest in Asiatic Turkey, occupies a situation of unrivalled beauty on a luxuriant plain at the eastern base of the Anti-Libanus, and 53 miles east-south-east of Beyrout, which forms its port, lat. 33° 27′ N., long. 36° 23′ E. The appearance of the city from a distance is beautiful in the highest degree.

The bright buildings, sparkling beneath a Syrian sun, rise out of a sea of various tinted foliage, while all around—save on the north-west, where stretches the long bare snow-white ridge of the Anti-Lebanon—extend charming gardens, rich cornfields, and blooming orchards, with the river Barrada (the Abana of Scripture) and its branches winding through until they lose themselves far to the east in the Lake Bahr-el-Merj, into which the Phege (the Pharpar of Scripture), a smaller stream, also flows. As in the case of all eastern cities, the expectations excited by a distant view of D. are by no means realized on a close inspection. The city proper is about 6 miles in circumference, and is partly surrounded by old tumble-down walls, portions of which date from early Roman times, while other parts are of Saracenic architecture, and some mere mud-patches of the present day. The streets generally are dirty and decayed, and so very narrow that a loaded donkey almost entirely blocks up the passage. The best street is 'Straight Street,' mentioned in the Acts of the Apostles in connection with St. Paul. The houses for the most part are very mean-looking structures, often presenting to the street nothing but a dead-wall with a doorway in it, while the best have rough mud-walls, with a projecting upper story extending so far over the narrow street that hands may be shaken from opposite windows. But as the interior of the city presents a sad contrast to its charming surroundings, so do the rich interiors of the houses contrast with their miserable externals. Fine marble-paved courts ornamented with trees, shrubs, and fountains, rooms with arabesqued roofs and walls, most luxuriously furnished, are the common features of all the dwellings of the wealthier classes. The principal buildings of D. are places of worship, chief of which is the Great Mosque—formerly a heathen temple, then a Christian church—composed of different kinds of architecture, and occupying a quadrangle 163 yards by 108 yards, the interior dimensions being 431 feet by 125. The floor is of marble tesselated, and covered with Persian carpets, and the walls and piers of the transept are enriched with beautiful devices formed of various colored marbles, while rows of noble Corinthian pillars divide the interior into nave and aisles. Altogether, this is one of the handsomest ecclesiastical buildings of which Mohammedans can boast. The citadel is large and imposing, but not strong; and the Great Khan is a splendid building, erected of black and white marble. There are many interesting remains of antiquity in D., but they are lost amid the mean modern structures and the bazaars. The latter are numerous, and finer than those of Cairo or Constantinople, and very well supplied with goods of oriental manufacture; each class of goods having a bazaar for itself. The manufactures of D. used to be important, consisting of silks, cottons, coarse woollen cloth, jewelry, saddlery, and arms; but her productions are now little more than sufficient for local consumption.

Before 1860, her looms were reckoned at 3000, while now they are said to barely reach 1300. The manufactures of the famous Damascene blades have long ceased to exist. This decline is chiefly caused by the taxation upon raw products. The trade with Bagdad was large; but in 1857 the caravan was plundered on its way across the desert, the loss to the merchants of D. being estimated at £40,000. This paralyzed the commerce. The annual caravan to Mecca from D. at one time consisted of some 50,000 or 60,000 persons, most of whom engaged to some extent in trade; but the facilities which in recent years have been afforded for making the pilgrimage by way of Egypt and the Red Sea, has caused a considerable diminution in the pilgrims, and consequently in the trade. One of the greatest blows at the prosperity of D. was struck in 1860, when the Druses (q. v.) entered the city, and destroyed about 6000 houses in the Christian quarter, killing from 3000 to 5000 persons, and selling many of the women into Turkish harems. The imports of British goods, chiefly plain and printed calicoes, cotton handkerchiefs, and cotton yarn, have been valued at £150,000. In 1870 the value of the goods brought into D. by the great (Bagdad) caravan was £90,000 Pop., including the adjoining village of Salahîyeh, 150,000: 130,000 are Mohammedans, 15,000 Christians, and 5000 Jews.

D. is perhaps the most ancient city in the world. Josephus attributes its foundation to Uz, the great-grandson of Noah; but whether it dates so far back or not, it is certain that it was a place of consequence in the days of Abraham. During the time of the Hebrew monarchy, it was the capital of Syria. It afterwards passed successively under the rule of the Assyrians, Persians, Macedonians, Romans, and Saracens; and finally, in 1516, it was captured by the Turks under Sultan Selim I.—in whose hands, with the exception of a short interval (from 1832 to 1840), when it belonged to the Pasha of Egypt, it has remained ever since. Under every change of dynasty and every form of government, D., unlike most cities, has retained its prosperity.

The vilayet of D. comprises all the territory between the Lebanon and the Euphrates—that is, all between lat. 31°—36° N., and long. 35°—41° E. The surface is for the most part level and very fertile, and produces grain of various kinds, hemp, flax, silk, cotton, madder, tobacco, and cochineal. The vilayet of D.—or of Syria as it is also called—is accounted the most important vilayet of Turkey. Pop. 518,750.

DA'MASK, the name given to all textile fabrics in which figures of flowers, fruits, or others not of geometrical regularity, are woven. The word is supposed to be derived from the city of Damascus having been an early seat of these manufactures. From the intricacy of the early process, the art of D. weaving was long a mystery confined to a few localities; but since the introduction

of the Jacquard-machine, it is extensively employed wherever ornament is wanted in the stuffs used for dress or house-furnishings.

The rich satins and brocades of Lyon and Spitalfields, the flowered ribbons of Coventry, and the bed and window curtains of Halifax and Bradford, are all examples of D. manufacture; but it is in the department of table-linen that the art has had its widest scope and greatest triumphs. The principal seats of the manufacture, on the continent of Europe, are at Courtrai and Liege in Belgium, and in some parts of Saxony, Silesia, and Austria; in England, to a considerable extent at Barnsley, in Yorkshire; in Ireland, at Belfast, Lisburne, and Ardoyne; and in Scotland, at Dunfermline, which may be called the metropolis of manufacture.

There are three descriptions of D. known in the trade—viz., 1. Full Harness, which is generally employed in patterns of limited size and minute detail, the peculiarity being that the Jacquard-machine only lifts one thread by each needle, and in such cases, the pattern is repeated to fill up the breadth wanted. 2. 'Single' or 'Common' D., in which any number of threads, from two to seven, can be lifted by one needle, to form the pattern; while the ground is produced by a set of five shafts and heddles, giving from twice to seven times the extent of pattern obtained from the same machine by the full-harness process. In full harness and single D. goods, a square fabric is considered the proper medium, that is, the warp and weft equal; but sometimes a thread or two less or more on warp or weft is used, according to the effect wanted to be produced. 3. In Double D., the pattern is produced in the same way as in single, and the ground formed by eight shafts and heddles, forming what the weavers call an eight-leaved twill, absorbing one-half more weft than warp, and giving that fine satin-like ground which distinguishes double damask. Besides these descriptions of D., a mixed cotton and woollen colored fabric in table-covers has been introduced, and is now manufactured extensively, the ground of which is woven with twelve shafts.

To give an idea of the capital required to work the finer branches of the trade, it may be mentioned, that it is quite usual for the mere designing and painting of a pattern to cost £50; and £70 has been paid for some extensive designs; while the famous 'Crimean Hero' pattern, containing portraits of the Queen, Prince Consort, Emperor Napoleon, &c., cost £600 of outlay, ere a yard of cloth could be brought to market, employing seven Jacquard-machines, consuming 50,000 cards, and containing 4800 threads in the square yard. In 1836, there were in Dunfermline 3000 D. and 517 diaper looms, and the capital embarked in the trade was estimated at £826,261, and the total number of persons employed, 5044. Steam-power was successfully inaugurated in 1849, when one factory employed about 100 power-looms. In 1877, there were 11 power-loom factories, with 4000 looms, two-thirds of which were employed in the weaving of damask. When it is considered that the production of one power-loom is equal to that of four hand-looms, some idea may be formed of the development of the trade since 1836.—A good description of D. and the D. loom is to be found in Chalmers's *History of Dunfermline*, vols. i. and ii.

DAMASKEE'NING, or DAMASCE'NING, is the art of producing upon ordinary steel certain ornamental appearances resembling those observed on the famous Damascus blades. Attention was first drawn to this branch of industry by the Crusaders, who brought from Damascus to Europe many articles made of superior steel, such as sword-blades and daggers. These were found to possess not only great elasticity, united with considerable hardness, but their surfaces were covered with beautiful designs, formed by a tissue of dark lines on a light ground, or light lines upon a dark ground, and occasionally by the inlaying of gold on the steel-blue ground. These Damascus blades appear to have been constructed of steel and iron welded together; and the elegant designs were brought out by immersing the blades in dilute acids, which, eating away unequally the surface, gave rise to the mottled appearance. In genuine Damascus blades, the designs run through the substance of the blade, and the *watering*, or regular, almost symmetrical figuring is not worn off by friction, or even grinding. Imitations of the watering of Damascus steel are produced on common steel by etching with acids; and in this way landscapes, inscriptions, and ornaments, and decorations in general, are imprinted on the steel-blue ground. Gold and silver are also inlaid in the higher-class of sword-blades and other articles. Gun-barrels are occasionally subjected to the process of Damaskeening. Attempts have been made in France to accomplish damaskeening by means of photography, but as yet with very imperfect results.

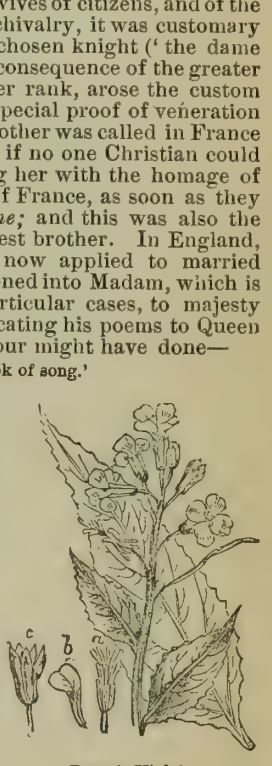
DA'MASUS, St., Bishop of Rome, was by extraction a Spaniard, and born probably early in the 4th century. In 366 A.D., he was elected Bishop of Rome, but had to struggle fiercely for the possession of his office with one Ursinus, who was supported by a considerable party. His career was throughout far from peaceful. It was mainly spent in subduing the still numerous Arians in the West; in combating the heresy of Apollinaris, which he caused to be condemned by the council assembled at Constantinople in 382; and in defending the cause of Paulinus against Meletius. He died 384. It is difficult to form a just estimate of D.'s character. His enemies used to call him *Auriscalpius Matronarum* ('The ear-tickler of the married ladies'), and hinted that he was in the habit of inducing rich female penitents to make testamentary bequests in his favor—a conspicuous vice of the clergy at that time; so much so, indeed, that Valentinian was obliged to issue an edict forbidding ecclesiastics to receive such bequests for the future. The edict was addressed to D., who was required to announce it to the church. On the other hand, he was a great friend of St. Jerome, and was primarily instrumental in inducing that learned divine to undertake a new translation of the Bible. His extant works consist of seven epistles, addressed to various bishops, and rather more than forty short poems, religious, descriptive, &c., but of little or no merit. The first edition was published at Rome by Sarrazanius in 1638. D.'s festival falls on the 11th December.

DAMBOO'L, a vast rock-temple of the Buddhists in Ceylon, containing, among a profusion of carvings, figures of Buddha of extraordinary magnitude. See *Ceylon*, by Sir J. Emerson Tennent (Lond. 1859), vol. ii. p. 577.

DAME (Lat. *domina*, a mistress), a title of honor which long distinguished high-born ladies from the wives of citizens, and of the commonalty in general. In the age of chivalry, it was customary even for a queen to be so called by her chosen knight ('the dame of his heart, of his thoughts,' &c.). In consequence of the greater courtesy shown towards women of higher rank, arose the custom of prefixing the word *ma* to *dame*, as a special proof of veneration and homage. Hence, too, the Virgin-mother was called in France *Notre-Dame* ('*Our* Mistress,' or Lady, as if no one Christian could exclusively claim the privilege of serving her with the homage of his heart). The daughters of the king of France, as soon as they came into the world, were called *Madame;* and this was also the sole title of the wife of the king's eldest brother. In England, the word D., though not much used, is now applied to married women of all classes. *Madame* is shortened into Madam, which is still a word of honor, applicable, in particular cases, to majesty itself. Thus, Alfred Tennyson, in dedicating his poems to Queen Victoria, speaks as a chivalrous troubadour might have done—

'Take, *Madam*, this poor book of song.'

DAME'S VI'OLET (*Hesperis*), a genus of plants of the natural order *Cruciferæ*, having four-sided or two-edged pods, and containing several species, annual and biennial herbaceous plants, natives, chiefly, of the middle and south of Europe. One only, the COMMON D. V., or WHITE ROCKET (H. *matronalis*), is found in Britain, in hilly pastures, but perhaps rather escaped from cultivation than a true native. It has an erect branched stem, with ovata-lancelot leaves, and terminated by numerous large lilac-flowers, which are scentless by day, but very fragrant at night, on which account this plant is cultivated in flower-pots by German ladies. The custom appears to have been an old English one also, and from it the plant derives its common name. The NIGHT-SCENTED ROCKET (*H. tristis*) is also a favorite flower in Germany.



Dame's Violet: *a*, a flower divested of calyx and carolla; *b*, a petal; *c*, calyx.

DAMIENS, ROBERT FRANÇOIS, known for his attempt to assassinate Louis XV., was born in 1714, at Tieulloy, a village near Arras, in France. He was evilly-disposed from his early youth, being known even then as *Robert le Diable*. On account of a robbery which he had committed, he was obliged to flee into Belgium in 1756, whence he returned to Paris about the end of the year. It was during his absence in that country that he formed the intention of assassinating his sovereign. The motives which led him to this are not well understood. He himself alleged that it was the conduct of the king towards the parliament; while a more popular, but apparently groundless opinion was, that he was instigated by the Jesuits. On the 5th of January 1757, having gone to Versailles on the previous day, he assiduously followed the king and his courtiers about everywhere; and about six o'clock at night, when the king was entering his carriage to leave Trianon, managed to stab him. The king, however, recognized his assassin, and D. was seized. The punishment inflicted on him was horrible. The hand by which he attempted the murder was burned at a slow fire; the fleshy parts of his body were then torn off by pincers; and, finally, he was dragged about for an hour by four strong horses, while into his numerous wounds were poured

molten lead, resin, oil, and boiling wax! Towards night, the poor wretch expired, having by an effort of will almost superhuman, kept his resolution of not confessing who were his accomplices—if, indeed, he had any. His remains were immediately burned, his house was destroyed, his father, wife, and daughter were banished from France for ever, and his brothers and sisters compelled to change their names.

DAMIE'TTA, a town of Lower Egypt, situated on the right bank of the chief of the Nile's eastern branches, about 8 miles from its mouth in the Mediterranean, in lat. 31° 25′ N., long., 31° 49′ E. It is in general ill and irregularly built, but it has some handsome mosques and marble baths, and several bazaars. Its commerce has been much injured by the prosperity of Alexandria. It still, however, carries on a considerable trade in exporting rice, which grows abundantly in the neighborhood, fish, &c.; and in importing charcoal, soap, silk, &c. The exports in 1871 were £85,200, the imports £150,600. It is connected by railway and telegraph with Cairo, &c. The cloth known as *dimity* received its name from D., where it was first manufactured. A bar at the mouth of the river prevents vessels of more than fifty or sixty tons burden for ascending to Damietta. Population, 37,100. The existing town was erected about 1251, but, prior to that, a city of the same name (more anciently Tamiáthis) stood about four miles to the south. It was strongly fortified by the Saracens, and formed on that side the bulwark of Egypt against the early Crusaders, who, however, succeeded in capturing it more than once. It was razed, and rebuilt further inland on the site it now occupies, by the Sultan Baybers.

DA'MMAR, or DA'MMAR PINE (*Dammara*), a genus of trees of the natural order *Coniferæ*, distinguished from all the rest of that order by their broad lanceolate leathery leaves, which have numerous nearly parallel veins, and by their seeds being winged, not at the end, but on one side. The tree from which the name, originally applied to its resinous product, has been extended to the whole genus, is the MOLUCCAN D. (*D. orientalis*), which grows on the high mountain-ridges of the Molucca islands. It grows to a great height, attains a diameter of nine feet, and generally has the lower part of the trunk beset with knots as large as a man's head. The timber is light and of inferior quality; and the tree is chiefly valuable for its resin, which is soft, transparent, hardens in a few days, and is then white, with a crystalline appearance. The resin often flows spontaneously from the tree in such quantity, that it hangs in masses like icicles of a handbreadth and a foot long. At another period of the year, it is yellow, and less valued. By incision, especially in the protuberances of the stem, it is obtained in large pieces. So long as *Dammar Resin* is soft, it has a strong smell; but loses it when it dries. It contains only a trace of volatile oil, but consists of two distinct resins, one of which is soluble in alcohol, the other not. It is light, brittle, and easily friable, readily soluble in oil of turpentine; quickly becomes viscid when heated; when sprinkled on burning coal, diffuses an odor like that of resin or mastich; readily takes fire, and burns with much smoke and a somewhat acid smell. It is used in Asia for domestic purposes, and in the arts like other resins; it is an article of commerce, and in Europe is employed in various ways to form varnishes, which dry quickly, have a very bright lustre, and being colorless, allow the beauty of the colors over which they are spread to be perfectly seen; but readily become viscid again, and are not permanent, so that this resin cannot be made a substitute for copal and amber. It is almost completely soluble in benzole, and in this solvent, makes an excellent colorless varnish for positive photographs on glass—it is, however, scarcely hard enough for negatives.—To this genus belongs also the KAURI PINE (q. v.) of New Zealand (*D. australis*), which produces the resin known as *Kauri Resin*, or *Kauri Gum*.—The word *Dammar*, *Dammer*, or *Damar*, signifies *resin* in some of the languages of India. The resin known as BLACK DAMMAR is obtained in the Molucca Islands from the trunk of *Marignia acutifolia*, a tree of the natural order *Amyridaceæ*. It is a semi-fluid soft resin, with a strong smell, becoming black when it dries: it is used as pitch, also to yield a kind of turpentine, which is obtained by distillation.

Canarium microcarpum, a tree of the same order, also a native of the furthest east, yields, by incision of the trunk, a viscid, odorous, yellowish substance, very similar to Balsam of Copaiva, which is called *Damar* or *Dammar*, and is used in naval yards as oakum, being mixed with a little chalk and the bark of reeds, and becomes as hard as a stone.—Quite distinct from all these is the resin also called *Dammar* or *Piney Dammar* in India, often also called Copal (q. v.) in India, and *Anime* (q. v.) in Britain, the produce of *Vateria Indica*, a large tree of the natural order *Dipteracæ*. It is obtained by wounding the tree, and when fresh, is clear, fragrant, and acridly bitter; when dried, it becomes yellow, brittle, and glass-like. It is used in India as a varnish (*Piney Varnish*), which is hard, tenacious, and much esteemed. It is also made into candles in Malabar, which, in burning, diffuse an agreeable fragrance, and give a clear light with little smoke. Some of these candles were sent to Britain, and were highly prized, but the excessive duty stopped the importation. *Shorea robusta*, the sal (q. v.), so much valued in India as a timber-tree, also of the natural order *Dipteraceæ*, and some other species of *Shorea*, yield a resin, also known as *Dammar*, and as *Ral* and *Dhoona*, which is much used in dockyards in India as pitch.

DAMMU'DAH, or DUMMO'DAH, a river of India, rises in Rangurh, a district in the presidency of Bengal, about lat. 23° 55′ N., and long. 84° 53′ E., and after a generally south-east course of 350 miles, it enters the Hoogly from the right, in lat. 22° 13′ N., and long. 88° 7′ E. The valley of the D.—traversed by the main railway between Calcutta and the North-west (The East Indian Railway)—abounds in coal and iron; and competent judges have calculated that bar-iron may here be manufactured 20 per cent. cheaper than it can be imported from Great Britain.

DA'MOCLES, one of the courtiers and sycophants of the elder Dionysius, the tyrant of Syracuse. It is recorded by Cicero that D., having lauded in the highest terms the grandeur and happiness of royalty, was reproved by Dionysius in a singular manner. The sycophant was seated at a table, richly spread and surrounded by all the furniture of royalty, but in the midst of his luxurious banquet, on looking upwards, he saw a keen-edged sword suspended over his head by a single horse-hair. A spectacle so alarming instantly altered his views of the felicity of kings.

DA'MON AND PY'THIAS, or PHI'NTIAS, two noble Pythagoreans of Syracuse, who have been remembered as models of faithful friendship. Pythias having been condemned to death by Dionysius the tyrant of Syracuse, begged to be allowed to go home, for the purpose of arranging his affairs, Damon pledging his own life for the reappearance of his friend. Dionysius consented, and Pythias returned just in time to save Damon from death. Struck by so noble an example of mutual affection, the tyrant pardoned Pythias, and desired to be admitted into their sacred fellowship.

DAMPER, a door or valve which, by sliding, rising and falling, turning on a hinge, or otherwise, diminishes the aperture of a chimney or air-flue; this lessens the quantity of air that can pass through a furnace or other fire, and thus 'damps' or checks the combustion.—The D. of a pianoforte is that part of the mechanism which, after a key is struck, and the finger is lifted up from the key, immediately checks or stops the vibration of the string. It consists of a second hammer, which, on the rising of the key, strikes the string and remains upon it, instead of bounding off as the sounding-hammer does. Perfect damping is always desirable, but seldom obtained, especially in upright pianofortes. In respect of damping, the pianofortes of the German makers are superior to the English. The more perfect the damping is, the more distinctly and clearly the passages and harmony are heard, while the instrument gains in purity of tone, when there is none of that confusion of sounds which arises from imperfect damping.

DAMPER is also the name given in Australia to a simple kind of unleavened bread formed of wheat-flour. It is made while traveling in the bush, and baked among the ashes of a fire often kindled for the purpose.

DA'MPIER, WILLIAM, a celebrated English navigator, was born of a Somersetshire family in 1652. He early went to sea, where he was soon distinguished alike by his intelligence and enterprise. Along with a party of buccaneers, D. crossed the Isthmus of Darien in 1679, and embarking on the Pacific in canoes and similar small craft, captured several Spanish vessels, in which they cruised along the coast of Spanish America, waging war with the Spanish subjects. In 1684, D. engaged in another buccaneering expedition, in which he coasted along the shores of Chili, Peru, and Mexico, sailing thence to the East Indies, touching at Australia, and after some time returning to England, where in 1691 he published an interesting account of the expedition, entitled *A Voyage Round the World*. He was afterwards deputed by government to conduct a voyage of discovery to the South Seas, in which he explored the west and north-west coasts of Australia, also the coasts of New Guinea, New Britain, and New Ireland, giving his name to the Dampier Archipelago and Strait (q. v.). The events of the latter part of D.'s life are not well known. Besides the one already mentioned, the following are his principal works: *Voyages to the Bay of Campeachy* (Lond. 1729); *A Treatise on Winds and Tides*; and a *Vindication of his Voyage to the South Sea in the Ship St. George* (1707).

DAMPIER ARCHIPELAGO AND STRAIT take their names from the famous navigator and buccaneer. The *strait*, which is 35 miles wide, separates the island of Waygiau from the north-west extremity of Papua or New Guinea, lying almost immediately under the equator, and about long. 131° E., so as to be, as nearly as possible, the antipodes of the mouth of the Amazon. The *archipelago*, again, is off the north-west coast of Australia, about lat. 21° S., and long. 117° E. The principal islands of the cluster are Enderby, Lewis, Rosemary, Legendre, and Depuch.

DAMPING OFF, in Horticulture, the death of plants from excess of moisture in the soil and atmosphere. Young seedlings in stoves and hotbeds are particularly liable to it. Although the cause is sufficiently obvious, prevention is not always easy; not only because some plants are very sensitive as to moisture, but also because the necessity of keeping sashes closed on account of temperature often stands in the way of the ventilation which would otherwise be desirable, and it is when a moist atmosphere stagnates around them, and the temperature is not very low, that plants are most liable to damp off.

DA'MSON, a rather small oval-fruited variety of the common plum, much esteemed for preserving, and not wholly unfit for dessert. The tree grows to a considerable height, but has a bushy, sloe-like appearance. It is extremely fruitful. There are many sub-varieties, with fruit of different colors, dark purple, bluish, black, yellow, &c. Damsons are produced in great quantities in some parts of England. D. pies, and *D. cheese*—made somewhat in the manner of fig-cake—are well known English luxuries. The name is a corruption of *Damascene*, from Damascus.—The MOUNTAIN D. or BITTER D. of the West Indies is the Simaruba (q. v.).

DAMUGGO', a large and populous town of Upper Guinea, Africa, situated on the left bank of the Niger, in lat. 7° N., long. 7° 50' E. The houses, built of mud, and supported by wooden props, are circular in shape. The town is dirty, and has a miserable appearance. The population, the number of which has not been ascertained with any degree of accuracy, support themselves by trade and the cultivation of the soil.

DA'NA, RICHARD HENRY, an American poet and novelist, was born in 1787 at Cambridge, Massachusetts. After leaving Harvard College, at which he had remained three years, he adopted law as a profession, but eventually renounced it, and applied himself to literature. In 1817, he became a contributor to the *North American Review*, his connection with this periodical continuing for three years, during a portion of which time he assisted in its editorship. The *Idle Man*, which contains many of his best prose efforts, was commenced in 1821, but proving a failure in a commercial point of view, was soon discontinued. Having at an earlier date published the *Dying Raven*, a poem of great merit, he came forward, in 1827, with the *Buccaneer*, and other poems, and in 1839 he delivered a series of lectures on Shakspeare. He died in Jan. 1879.—RICHARD H. DANA, a son of D., is well known as the author of *Two Years before the Mast* (enlarged ed. 1869). *To Cuba and Back* appeared in 1859. D. was also a distinguished authority on maritime law. He was nominated in 1876 to be ambassador in England, but the appointment was not sanctioned by the Senate. He died 6th Jan. 1882.

DA'NAE, the daughter of Acrisius, king of Argos, and Ocaleia. An oracle had announced that she would one day give birth to a son, who should kill his grandfather. Acrisius, of course, felt extremely uncomfortable after this declaration, and took every precaution to keep D. a virgin. He shut her up in a dungeon, where, nevertheless, she was visited by Zeus in a shower of gold, and became, in consequence, the mother of Perseus. Acrisius put both the mother and child into a chest and exposed them on the sea. The chest, however, drifted ashore on the island of Scriphos, and D. and her child were saved. D. remained in the island until Perseus had grown up and become a hero famous for his exploits. She afterwards accompanied him to Argos. On his arrival, Acrisius fled, but was subsequently slain accidentally by Perseus at Larissa.

DA'NAUS, a mythical personage, the son of Belus and Anchinoë, brother of Ægyptus, and originally ruler of Libya. Thinking his life in danger from the machinations of his brother, he fled to Argos, accompanied by his fifty daughters, known as the DANAIDES, where he was chosen king, after the banishment of Gelanor, the last of the Inachidæ. The fifty sons of Ægyptus followed him, and under the pretence of friendship, sought the hand of his daughters in marriage. D. consented, but on the bridal-night he gave his daughters each a dagger, and urged them to murder their bridegrooms in revenge for the treatment he had received from Ægyptus. All did so, except one, Hypermnestra, who allowed her betrothed, Lynceus, to escape. D., as may naturally be supposed, found great difficulty in obtaining new husbands for his daughters; and in order to get them off his hands, instituted games, where they were given as rewards to the victors although they could scarcely have been considered very tempting prizes. As a punishment for their crime, they were compelled, in the under-world, to pour water forever into a vessel full of holes. So runs the myth; but Strabo mentions an old tradition, which declares D. and his fifty daughters to have provided Argos with water, which is probably the origin of the scene in Hades. Greek art, of course, represents the Danaides in conformity with the popular myth. The tomb of D., in the Agora of Argos, was shown as late as the time of Pausanias.

DA'NBY, FRANCIS, A.R.A., a painter, born about six miles from Wexford, in Ireland, 16th November 1793. He was educated in the school of the Society of Arts, Dublin, and soon gave indications of superior artistic talent. His first attempts were sent to the Dublin Exhibition. After 1820, he took up his residence at Bristol, whence he sent to the Royal Academy, London, his 'Disappointed Love' (1821), 'Warriors of the Olden Time listening to the Song of their Minstrel' (1823), and 'Sunset at Sea after a Storm' (1824). In 1825, D. produced 'The Delivery of Israel out of Egypt;' in 1826, 'Christ Walking on the Sea;' in 1827, 'The Embarkation of Cleopatra on the Cyndus;' and in 1828—1829, 'An Attempt to Illustrate the Opening of the Seventh Seal,' 'The Passage of the Red Sea,' and 'The Deluge.' Circumstances now induced him to visit the continent, where he resided till 1841, during which interval he executed very few paintings.

On his return, he took up his abode at Exmouth, where he died in 1861. Among his later works, may be mentioned, 'A Morning at Rhodes' (1841), 'The Enchanted Island' (1841), 'The Contest of the Lyre and Pipe in the Valley of Tempe' (1842), 'The Tomb of Christ after the Resurrection,' 'Fiensford Lake (Norway)—a Sudden Storm passing off,' 'Caius Marius among the Ruins of Carthage' (1848), and 'The Departure of Ulysses from Ithaca' (1854).

DANCE OF DEATH (Lat. *Chorea Machabæorum*, Fr. *La Danse Macabre*), a name given to a certain class of allegorical representations, illustrative of the universal power of Death, and dating from the 14th century. When the introduction of Christianity first banished the ancient Germanic conception of a future state, a new description of death-mythology arose, partly out of biblical sources, partly out of the popular character itself, wherein the Last Enemy was represented under simple and majestic images, such as that of a husbandman watering the ground with blood, ploughing it with swords, rooting out weeds, plucking up flowers, or felling trees, sowing it with corpses; or of a monarch assembling his armies, making war, taking prisoners, inviting his subjects to a festival, or citing them to judgment. But with a gradual change in national manners came a change in the mode of treating the subject, and it was associated with everyday images, such as the confessional, chess-playing, and above all, with the adjuncts of a festival—viz., music and dancing. This tendency to familiarize the theme increased during the confusion and turmoil of the 14th c., when the national mind alternated between fits of devotion and license, or blent both elements in satire and humor. Such a mood as this naturally occupied itself with personifying Death, and adopted by preference the most startling and grotesque images it could find—that of a musician playing to dancing-men, or a dancer leading them on; and as the dance and the drama were then intimately connected, and employed on religious occasions, this particular idea soon assumed a dramatic form.

This drama was most simply constructed, consisting of short dialogues between Death and four-and-twenty or more followers, and was undoubtedly enacted in or near churches by religious orders in Germany during the 14th c., and at a rather later period in France. It would appear that the seven brothers, whose martyrdom is recorded in the 7th chapter of the 2d Book of *Maccabees*, either played an important part in the drama, or the first representation, which took place at Paris, in the Cloister '*aux Innocents*,' fell upon their festival, and hence the origin of the ancient name, Chorea Machabæorum, or La Danse Macabre. As early as 1400, the dramatic poem was imitated in Spain, and appears there in 79 strophes of 8 lines each (*La Dança General de los Muertos*), but it did not spread; while the French, having a love for pictorial representation, very early affixed an illustration to each strophe, and in 1425 painted the whole series on the churchyard-wall of the Cloister of the Innocents, where the Dance of Death was habitually enacted.

We find the subject treated in painting, sculpture, and tapestry, in the churches of Anjou, Amiens, Angers, Rouen, to say nothing of the numerous wood-cuts and accompanying letter-press which succeeded the invention of printing. From Paris, both poem and pictures were transplanted to London (1430), Salisbury (about 1460), Wortley Hall in Gloucestershire, Hexham, &c.

But nowhere was the subject so variously and strikingly treated as in Germany. A picture in one of the chapels of the Marienkirche, at Lübeck, still, in spite of repeated re-paintings, bearing the unmistakable impress of the 14th c., exhibits the very simplest form of the drama, and has some genuine Low-German verses attached to it. Here we see 24 figures, partly clerical, partly lay, arranged in a descending scale, from the pope himself down to a little child, and between each of them a dancing-figure of Death, not in the form of a skeleton, but a shrivelled corpse, the whole being linked in one chain, and dancing to the music of another Death. This representation is almost the same as a very ancient one at La Chaise-Dieu, in Auvergne, and points to the identity of the original dramatic spectacle in both countries.

The celebrated Dance of Death on the cloister walls of the Klin-

genthal, a convent in Basel, though painted probably not later than 1312, exhibited a departure from the simplest form—the number of persons exceeding the original 24, and the chain being broken up into separate couples. But both alike are only to be regarded as scenes from a drama, and cannot, therefore, be justly compared with a contemporary Italian painting, the 'Triumph of Death,' by Andrea Orcagna. And the acted drama enduring till the 15th c., we find that while there were varieties in the paintings, the poem, which was the most important feature, remained almost unchanged.

About the middle of the 15th c., however, the drama being altogether laid aside, the pictures became the main point of interest, the verses merely subsidiary. Accordingly, we find from this time the same pictures repeated in different places, with different verses, or no verses at all, till at length both verses and pictures entirely change their original character. The Dance of Death being transferred from the quiet convent walls into public places, gave a new impulse to popular art. Duke George of Saxony had, in 1534, the front of his Dresden castle ornamented with a life-size bas-relief of the subject, and other representations are to be found at Strasburg and Bern. There was a Dance of Death painted round the cloister of old St. Paul's in London, in the reign of Henry VI.; and there is a sculptured one at Rouen, in the cemetery of St. Malcou. But Holbein has the credit of availing himself most effectively of the original design, and giving it a new and more artistic character. Departing from the idea of a dance, he illustrated the subject by 53 distinct sketches for engravings, which he called 'Imagines Mortis.' The originals of these are at St. Petersburg, and impressions of them have been frequently repeated under different names.

We may cite as authorities on this subject, Peignot's *Recherches sur les Danses des Morts* (Dijon and Paris, 1826); Massman's *Baseler Todtentänze* (Stuttgart, 1847), and Douce's *The Dance of Death* (Lond. 1833).

Dancette.

DANCE'TTE, one of the lines of partition in Heraldry, which differs from Indented (q. v.) only in the greater size of the notches. The indentations where the division is *per fess* dancette, never exceed three in number.

DANCING may be defined in a general way as the expression of inward feelings by means of rhythmical movements of the body, especially of the lower limbs, usually accompanied by music. Dancing may almost be said to be as old as the world, and prevails in rude as well as in civilized nations. Children, and also the lower animals, dance and gambol as by instinct.

Our early records, sacred and profane, make mention of dancing, and in most of the ancient nations it was a constituent part of their religious rites and ceremonies. They danced before their altars and round the statues of their gods. The Greek chorus, 'in the oldest times, consisted of the whole population of the city, who met in the public place (*choros*, the market-place), to offer up thanksgivings to their country's god, by singing hymns and performing corresponding dances.' The Jewish records make abundant mention of dancing. Moses and Miriam danced to their song of triumph, when the Israelites passed through the Red Sea as on dry land; David danced before the Ark. It is certain that the primitive Christians danced at their religious meetings, though we have no mention of this in the New Testament. The Greeks made the art of dancing into a system expressive of all the different passions, the dance of the Eumenides, or Furies, especially, creating such terror, that the spectators seemed to see these dreaded deities about to execute Heaven's vengeance on earth. The most eminent Greek sculptors did not disdain to study the attitudes of the public dancers for their art of imitating the passions. In Homer, we read of dancing and music at entertainments. Aristotle ranks dancing with poetry, and says, in his *Poetics*, that there are dancers who, by rhythm applied to gesture, express manners, passions, and actions. In Pindar, Apollo is called the dancer; and Jupiter himself, in a Greek line, is represented as in the act of dancing. The Spartans had a law obliging parents to exercise their children in dancing from the age of five. This was done in the public place, to train them for the armed-dance. They were led by grown men, and all sang hymns and songs as they danced. The young men danced the Pyrrhic dance, in four parts, expressive of overtaking an enemy and of a mock-fight.

Dancing, as an entertainment in private society, was performed in ancient times mostly by professional dancers, and not by the company themselves. Among the sedate Romans, in fact, it was considered disgraceful for a free citizen to dance, except in connection with religion. Having professional dancers at entertainments is still the practice among Eastern nations. In Egypt there are dancing and singing girls, called Almé, who improvise verses as in Italy. They are highly educated, and no festival takes place without them. They are placed in a rostrum, and sing during the repast; then descend, and form dances that have no resemblance to ours. All over India there are Nautch girls or Bayaderes (q. v.), who dance at festivals and solemnities.

It is among savage nations that the passion for dancing is most strongly manifested. Their dances are mostly associated with religion and war; and the performers work themselves into a state of frantic excitement—a kind of mechanical intoxication. As civilization advances, dancing—amateur dancing, at least—assumes a more and more subdued character. As a social amusement and a healthful exercise, dancing has much to recommend it; the chief drawbacks are the ill-ventilated and overheated rooms in which it is generally performed. By many, it is unfavorably regarded in a moral point of view; but this seems a relic of that outburst of puritanism that characterized the 17th c., and which saw sin in every joyous excitement. Dancing is doubtless liable to abuse, but not more so than most other forms of social intercourse. Connected with the subject of dancing, see ACROBATS, BALLET, PANTOMIME, COUNTRY-DANCE, QUADRILLE, POLKA, &c.

DANCING MA'NIA, a form of epidemic disorder allied to hysteria (q. v.), and evidently the result of imitative emotions acting upon susceptible subjects, under the influence of a craving for sympathy or notoriety. There is little doubt that imposture entered to a considerable extent into all the epidemic forms of the dancing mania, which indeed were usually attended and followed by consequences that showed but too clearly the presence of impure motives; but there is also evidence that in many cases the convulsive movements were really beyond the control of the will, whatever may have been the original character of the motives that prompted them. Epidemics of this sort were common in Germany during the middle ages, and are formally described as early as the 14th c.; in Italy, a somewhat similar disease was ascribed to the bite of a spider called the Tarantula (see TARANTISM); and similar convulsive affections have been witnessed in Abyssinia, India, and even in comparatively modern times and in the most civilized countries in Europe, under the influence of strong popular excitement, especially connected with religious demonstrations. But the true dancing mania of the middle ages had its theater chiefly in the crowded cities of Germany.

In July 1374, there appeared at Aix-la-Chapelle assemblies of men and women, who, excited by the wild and frantic, partly heathenish, celebration of the festival of St. John, began to dance on the streets, screaming and foaming like persons possessed. The attacks of this mania were various in form, according to mental, local, or religious conditions. The dancers, losing all control over their movements, continued dancing in wild delirium, till they fell in extreme exhaustion, and groaned as in the agonies of death; some dashed out their brains against walls. When dancing, they were insensible to external impressions, but haunted by visions, such as of being immersed in a sea of blood, which obliged them to leap so high, or of seeing the heavens open, and the Saviour enthroned with the Virgin Mary. The frenzy spread over many of the towns of the Low Countries. Troops of dancers, inflamed by intoxicating music, and followed by crowds, who caught the mental infection, went from place to place, taking possession of the religious houses, and pouring forth imprecations against the priests. The mania spread to Cologne, Metz, and Strasbourg, giving rise to many disorders, impostures, and profligacy. These countries were generally in a miserable condition; and arbitrary rule, corruption of morals, insecurity of property, and low priestcraft, prepared the wretched people, debilitated by disease and bad food, to seek relief in the intoxication of an artificial delirium. Exorcism had been found an efficacious remedy at the commencement of the outbreak; and in the beginning of the 16th c., Paracelsus, that great reformer of medicine, applied immersion in cold water with great success. At the beginning of the 17th c., the St. Vitus's Dance, as the affection was called (see CHOREA), was already on the decline; and we now hear of it only in single cases as a sort of nervous affection. A detailed account of the phenomenon is given in Hecker's *Epidemics of the Middle Ages*. See CONVULSIONARIES.

Dandelion:
a, leaves, scape, and head of flowers; *b*, head of ripe fruit with pappus.

DANDELI'ON (*Leontodon taraxacum*, or *Taraxacum officinale*), a plant of the natural order *Compositæ*

sub-order *Cichoraceæ*, common throughout Britain and the whole of Europe, in pastures and by way-sides, and now also so perfectly naturalized in many parts of North America, as to be there one of the most familiar spring-flowers. The names D. and Leontodon (Fr. and Gr. lion's-tooth) both have reference to the form of the leaves. The whole plant abounds in a milky juice, containing a peculiar crystalline principle called *Taraxacin;* has a bitter taste; and is tonic, deobstruent, and diuretic. D. root is employed in medicine, in the form of infusion, decoction, and extract, chiefly in diseases of the liver and chronic affections of the digestive organs. It contains resin, inulin, sugar, &c. When roasted and ground, it is also sometimes used as a substitute for coffee: *D. coffee*, however, is usually a mixture of ordinary coffee and the powder or extract of D. root; and *D. chocolate* is composed of one part of common chocolate and four parts of the powder of D. root. The young leaves, when blanched, are a good salad, resembling lettuce or endive.

DA'NDOLO, a famous Venetian family, which has given four doges to the republic. The most illustrious of its members was Enrico D., born about 1110 or 1115 A.D. Eminent in learning, eloquence, and knowledge of affairs, he ascended from one step to another, until, in 1173, he was sent as ambassador to Constantinople, and in 1192 was elected doge. In this latter capacity, he extended the bounds of the republic in Istria and Dalmatia, defeated the Pisans, and (in 1201) marched at the head of the Crusaders. He subdued Trieste and Zara, the coasts of Albania, the Ionian Islands, and Constantinople (17th July 1203). When the Emperor Alexius, who had been raised to the throne by the exertions of D., was murdered by his own subjects, D. laid siege to Constantinople, and took it by storm, 13th April 1204. He then established there the empire of the Latins, and caused Count Baldwin of Flanders to be chosen emperor. By the treaty of partition which he concluded with the other leaders of the crusade, Venice obtained possession of some of the islands of the Ionian Sea, and of the Archipelago, several harbors and tracts of land on the Hellespont, in Phrygia, the Morea, and Epirus, an entire quarter of Constantinople, and also, by purchase, the island of Candia. Soon after this, D. died (June 1, 1205), in Constantinople, and was buried in the Church of St. Sophia. His monument was destroyed by the Turks at the taking of Constantinople in 1453.

DA'NEBROG, ORDER OF, the second of the Danish orders, was instituted by King Waldemar in 1219. The word *brog* in old Danish signifies 'cloth,' and thus D. is equivalent to the cloth or banner of the Danes. The order is a sort of glorification of the old national flag of Denmark, which long floated, like the oriflamme of France, at the head of the army. It is meant to recompense services rendered to the state, whether civil or military, and irrespective of age or rank. The decoration of the order consists in a cross of gold *pattée*, enamelled with white, and suspended by a white ribbon, embroidered with red.

DA'NEGELT, or DANEGOLD, a tribute, first of 1*s*., and afterwards of 2*s*., levied on every hide of land by the Anglo-Saxons, for the purpose of meeting the outlay requisite for defending the country against the Danes. The tax was continued after the Conquest, as one of the rights of the crown, till the time of Stephen.

DA'NE-LAGE, or DANE-LAW. After the overthrow of the Danes under Guthrun at Ethandune by King Alfred (878 A.D.), a treaty was concluded between the two, in virtue of which the entire kingdom of Wessex, from Somerset to Kent, was evacuated by the Danes, who were, however, allowed to retain the greater part of the east coast of England, including the whole of Northumbria. The district was called Danelagh or Dane-law (which name it retained down to the Norman Conquest), because the inhabitants were ruled by Danish and not by English law.

DA'NIEL, a Hebrew prophet, who flourished about 600 B.C. He was a contemporary of Ezekiel, and was carried captive to Babylon in the fourth year of Jehoiakim. He was one of the youths selected to be brought up for future service at the court of the conqueror, and received instruction in the learning of the Chaldæans. His skill in the interpretation of dreams procured for him the royal favor. He rose to be governor of the province of Babylon under Nebuchadnezzar; and under Darius, the Mede, to be first president of the whole Medo-Persian empire, a dignity only inferior to that of Darius himself. The time and the place of his death are alike unknown. He was alive, however, in the first year of the reign of Cyrus, but did not return to Judæa with his countrymen on their release from captivity. Epiphanius and others affirm that he died at Babylon; but the common tradition is, that he expired at Susa or Shusan in Persia, when upwards of ninety years of age; and at the present day, a tomb bearing his name is the only standing building among the ruins of that ancient city. D. was the only one of the Hebrew prophets who enjoyed a high degree of worldly prosperity. Ezekiel mentions him as a model of wisdom and piety.—The Book of D. consists partly of historical notices of D., and partly of visions and prophecies, some of which are written in Chaldee. The genuineness of the book, in its present form, has been much disputed in recent times.

DANIEL, SAMUEL, an English poet, was the son of a music-master, and was born in 1562, near Taunton, in Somersetshire; entered Magdalen Hall, Oxford, in 1579, but quitted the university without taking a degree. For some time he acted as a tutor to Anne Clifford, daughter of the Earl of Cumberland. In 1603, he was appointed master of the queen's revels, and inspector of the plays to be represented by the juvenile performers. Subsequently, he held other offices about the royal household. Towards the close of his life, he retired to a farm which he possessed at Beckington, in his native county, where he died, October 14, 1619. D. is an elegant, if not a great poet. His writings are pervaded by a moral thoughtfulness and purity of taste which are very remarkable, but lack that vital energy of movement and memorableness of expression which result from genuine inspiration. The 'well-languaged Daniel' is therefore not the most interesting of the Elizabethans, although his style is quite modern. His works include sonnets, epistles, masks, and dramas; but his chief production is a poem in eight books, entitled a *History of the Civil Wars between York and Lancaster*.

DA'NIELL, JOHN FREDERICK, D.C.L., a distinguished English savant, was born in London, March 12, 1790. He was a pupil of Professor Brande, along with whom he made several scientific tours; was elected a fellow of the Royal Society in 1814, and in 1816 started, in connection with Professor Brande, the *Quarterly Journal of Science and Art*. From this period, D. devoted almost the whole of his time to the subjects of chemistry and meteorology.

In 1823, he published his *Meteorological Essays*, which is still the standard-work on meteorology; and in 1824 the Horticultural Society awarded him their silver medal for his *Essay on Artificial Climate*. In 1831, he was appointed Professor of Chemistry in King's College, London; and in 1839 published his *Introduction to Chemical Philosophy*. In 1843, he received the degree of D.C.L. from the university of Oxford. He also enjoyed the great honor of being the only person who ever obtained all the three medals in the gift of the Royal Society. Besides his professorship in King's College, D. also held the post of Lecturer at Addiscombe, and of Examiner in Chemistry to the university of London. He died March 13, 1845. D.'s *Meteorological Essays* was the first attempt to account, in a truly philosophical manner, for the known phenomena of the atmosphere. Besides the works mentioned, D. wrote a large number of interesting and valuable papers for the Royal Society. For an account of his new hygrometer, see HYGROMETER.

DANISH LANGUAGE AND LITERATURE. The Danish language, which, with slight modifications, is common to the three Scandinavian kingdoms, is a branch of the ancient Gothic, and has been retained almost in its original form in Iceland. The oldest memorials of the Danish are codes of laws, as the *Skaanske Lov*, and the old and new *Sjællandske Lov*, promulgated by Valdemar the Great in 1162 and 1171; but these, no less than the writings of Harpestreng, canon of Roeskilde (1244), already show marked deviations from the Icelandic, in consequence of the intermixture of the Anglo-Saxon, English, and Norman elements, due to the Danish occupation of England, and the immigration of monks and artisans into Denmark from Britain. The influence of the English dialect was again modified towards the close of the 12th c. by the influx of Germans into the country. Saxo Grammaticus, the father of Danish history, who died in 1204, wrote, like almost all his ecclesiastical brethren at that day, in Latin, as did also his contemporary, the knight Svend Aagesen. The Danish *Kæmpeviser* are the richest poetical remains of the folk-lore of the middle ages in Europe, and consist—1. Of narratives and songs of giants, demigods, and other supernatural creatures of the Scandinavian mythology; 2. Of romantic songs and tales connected with these mythical beings; and, 3. Of historical verses, referring to a later period. The names of the writers are unknown, and these compositions seem rather to be the expression of the entire people, than the production of individual poets. Many have, from time immemorial, been associated with certain national melodies, which have secured them a permanent place in the hearts of the people, whose disposition leads them to dwell with fondness on the memory of by-gone times and events, and to seek in the glory of the past a compensation for the national humiliation and reverses of the present.

The first printed collection of the Kæmpeviser is due to the royal historiographer, Vedel, and appeared at Ribe, 1592; another edition (Copenh. 1695) by Peter Syv found its way to almost every peasant's cottage; but the most complete of any is probably that by Nyerup and Rabek, in 5 vols. (Copenh. 1810—1814). After the Reformation, the national literature was comparatively neglected, for the composition of poor theological treatises and

bald versions of the Psalms. Among the best of the writers in this department we may instance Christian Pedersen (born 1480), who, after having made a metrical version of the ancient national chronicles, devoted himself to the diffusion of the Lutheran faith, and made Danish translations of the New Testament, and the reformer, Hans Taussen (born 1494), who composed catechisms, and translated the Pentateuch into Danish. The Danish language acquired stability and new life by the translation of the whole Bible, which, by order of King Christian III., was effected in 1550 by Palladius and other professors of the university. The close of the 16th c. was memorable for the many admirable writers on history which it produced in Denmark. Among those who edited and annotated the ancient Danish and Icelandic historical chronicles we may mention Peder Claussen, A. S. Vedel, and Axil Hvitfeldt, whose respective works supply invaluable materials to the historical inquirer. These men were contemporaries of the great astronomer, Tycho Brahé, and, like him, experienced the caprices of court-favor. The 17th c. shows a large number of able writers, among whom were Longomontanus, the pupil of Tycho Brahé; the family of Bartholin, numbering seventeen in three generations, who were all known for the ability of their writings on medical, philosophical and mathematical subjects in Latin, German, and Danish; the family of the Pontoppidans, eleven in number, all of whom have left memorials of their proficiency in philology and history, and of their acquaintance with the theology and natural history of the times; Arreboe, the father of Danish poetry, who wrote on sacred subjects, and in his principal work, *Hexameron*, described in epic verse the events of the first six days of creation; Steno, the anatomist, and the lyrical poet, T. Kingo. A new era began with the genial and versatile Ludvig Holberg (born 1684), who wrote in Latin, French, German, and Danish, and has left very numerous works on history, biography, and topography, but whose fame among his countrymen will ever rest on his inimitable comedies, farces, and satirical compositions. His genius and his writings gave an impetus to the cultivation of the Danish language, which not all the studied neglect of the court-party, and their persistence in the use of German, could check. The 18th c. produced many good historical critics—as, for instance, Torfæus, Langebek, Schöning, and Suhm, Magnæus, the Icelandic scholar, Thorlacius, and Thorkelin, learned in ancient northern lore, and Rosenvinge, the jurist. Among the epic and dramatic poets of that age, Ewald stands foremost, whose national lyrics evince true poetic genius.

The close of the century was, however, unfavorable to mental development and freedom of thought; and the best writers, as in the case of Malte Brunn and the poet Heiberg, were either compelled to leave the country, or to abstain from giving expression to their opinions. Among the more recent writers, we may instance the poet Oehlenschläger—whose national tragedies and lyrical legends of Scandinavian mythology have rekindled all the long slumbering fire of Danish patriotism—Baggesen, Winther, Hauch, F. P. Müller, Heiberg, Hertz, H. C. Andersen, Rosenhoff, Holst, and Overskou. Ingemann, who stands first as a writer of historical novels, also wrote good lyrics, and his subjects were generally taken from the national history. Short tales or novellettes would seem, however, to be more congenial to the taste of the Danes, and most of their best writers of fiction have adopted this form—as, for instance, Blicher, Heiberg, Trane, Andersen, Winther, Carit Etlar, &c. The names of Oersted, Schouw, Forchhammer, Rask, Finn Magnussen, Worsaa, Grundtvig, Petersen, and Eschricht, sufficiently attest the stand that the physical sciences, philology and archæology, have attained in Denmark in the present day. Thorwaldsen, by the gift of his works to the nation, has created a taste and appreciation for sculpture and the arts generally among his countrymen, to which they were previously strangers, and has thus given a new direction to the mental culture of the Danes.

The Danish language is peculiarly soft, from the great number (ten) of distinct vowel-sounds which it contains, the absence of gutturals, and the softening of all the consonants. It may be said to bear the same relation to the ancient tongue, the *Norræna* or *Dönsk Tunga*, that Italian does to Latin, force and precise inflections having been sacrificed for melody and simplicity.

DANKALI', an independent state of Abyssinia, extending along the south-west border of the Red Sea, between lat. 13°—15° 30' N., a range of mountains running almost parallel to the coast, and about 50 miles distant from it, forming its boundary inland. D. is a sterile territory, being almost quite destitute of water. The heat is excessive, often reaching 110° F. The inhabitants are composed of various Arab tribes, and are indolent, treacherous, and cruel. They number about 70,000.

DA'NNECKER, Joh. Heinr. von, a German sculptor, was born at Waldenbuch, in the district of Stuttgart, 15th October 1758. His parents were in the humblest circumstances; but through the favor of the Duke of Würtemberg, he received a good education at the Military Academy at Ludwigsburg. His artistic talents were rapidly developed. In 1780, he obtained the prize for the best model of 'Milo of Croton destroyed by the Lion;' and in 1783 went to Paris, where he studied for two years under Pajou; after which, he proceeded to Rome, where he met with Goethe, Herder, and Canova, to the last of whom he was indebted for much valuable instruction in his profession. At Rome D. remained till 1790. Here he executed in marble his statues of 'Ceres' and 'Bacchus.' On his return to Germany, the Duke of Würtemberg appointed him Professor of Sculpture in the Academy at Stuttgart, in which city he resided til his death, 8th December 1841. D. was undoubtedly one of the best of modern sculptors.

His forte lay in expressing individual characteristics, in which respect he has not been surpassed. This gives a great value to his busts of distinguished persons such as Schiller, Lavater, Gluck, and the kings Frederick and William of Würtemberg. His perceptions of the beautiful and the delicate, especially in the female form, are also considered by his countrymen to be more exquisite and true than those of Canova himself. His earlier works are chiefly pagan in their subjects, while his later ones are Christian, and are pervaded by a pensive idealism. Of the former, besides those already mentioned, the principal are 'Sappho,' 'Love,' 'Psyche,' and 'Ariadne as the Bride of Bacchus riding on a Leopard (at Frankfurt);' of the latter, 'Christ,' 'John the Baptist,' and 'Faith.'

DA'NTÉ (properly, Durante) ALIGHIE'RI, one of the greatest poets of all time, and incomparably the greatest among the Italians, was born in Florence in 1265. The outward circumstances and fortunes of his life are involved for the most part in great uncertainty. His family was, by his own account, one of the most illustrious in the city. His father dying while D. was young, his education devolved upon his mother, Bella. In this duty, in which she displayed great fidelity and judgment, she seems to have been counselled and aided by the great statesman, scholar, and poet, Brunetto Latini. The elements of knowledge D. probably acquired in Florence; in riper years, he studied philosophy at Bologna and Padua. After his banishment, he pursued theology for a time at Paris, and, if Boccaccio were to be believed, even visited England. His studies, however, did not prevent him from discharging the public duties of a citizen. He fought in the successful battle with the Aretines at Campaldino in 1289, and was present at the taking of the fortress of Caprona, 1290. What civil offices he first held, we do not know, but it is certain that he was sent on several embassies, and at last, in 1300, rose to the highest dignity of the city, being chosen one of the Priori for two months an office which was the source of his subsequent unhappy fortunes. Florence, on the whole, belonged to the party of Guelphs (q. v.), but was divided into the two factions of the Neri and Bianchi (the *blacks* and *whites*). The Neri were the unconditional adherents of the pope, and this of course gave to the other faction a more Ghibelline leaning. See Guelphs and Ghibellines. A tumult in the city, occasioned by the heads of the ultra-Guelphic or *black* party, caused their temporary expulsion from Florence. They hurried to Rome, to lay their complaints before his Holiness. D., who belonged to the Bianchi, was sent by his party to Rome, to counteract their machinations; but Boniface VIII., in concert with the Neri, got Charles of Valois, brother of Philip IV. of France, to come to Florence and restore peace under the title of peacemaker. This explains the deadly enmity of D. to Boniface. The peace established by Charles of Valois consisted in recalling the banished leaders of the Neri, in giving up the houses and property of the Bianchi to be plundered, and banishing many of them, and among others Dante. D. never entered his native city again, and his whole subsequent life was unsettled, spent in various places, and under various protectors, at Arezzo, Verona, Padua, &c.

In 1304, the Bianchi made a final attempt to return to Florence by force of arms, which failed; and it was probably on this occasion that D. went to Paris. The march of Henry VII. to Rome in 1310 recalled him to Italy, and he endeavored, by addressing ardent letters to the Italian princes, to promote the cause of the empire, which had now become his own. It was probably with this view and at this time, that his work *De Monarchia* was written. The unsuccessful siege of Florence, and the death of the emperor, which followed in 1313, annihilated the last hopes of D., and he spent the closing years of his life at Ravenna, under the protection of Guido Novello da Polenta. He went on a mission for this prince to Venice, returned sick, and died on the 14th September 1321.

As not unfrequently happens with distinguished men, an accidental circumstance in D.'s early youth had made an indelible impression on the soul of the poet, and, as he himself expresses it, awaked in him a 'new life.' At a family festivity, he had seen Beatrice Portinaci, then eight years old, the daughter of a rich citizen, and the love that sprang up in the heart of the nine years' old boy became the fountain of the poetical inspiration of his life. How pure, chaste, and tender this love was, is testified by the *Vita Nuova*, his first work, which appeared about 1300. It is a

collection of poems or canzoni, bearing upon this youthful love, and along with each piece is given a history of its origin and a minute analysis. The best edition of this collection is that prepared by the Marquis Trivulzio (Mil. 1827). Beatrice married a nobleman, Simone de Bardi, and died young about 1290. D. himself afterwards married a lady named Gemma, of the powerful House of Donati.

His immortal work, the *Divina Commedia*, depicts a vision, in which the poet is conducted first by Virgil, the representative of human reason, through hell and purgatory; and then by Beatrice, the representative of revelation; and finally by St. Bernard, through the several heavens, where he beholds the triune God. The name *Commedia* was given to the work by the poet himself—because, beginning with the horrible, it ends cheerfully; and because, in respect of style, it is lowly, being written in the vulgar tongue. The epithet *Divina* was added by the admiration of after-times. Hell is represented in the poem as a funnel-shaped hollow, formed of gradually contracting circles, the lowest and narrowest of which is at the earth's center. Purgatory is a mountain rising solitary from the ocean on that side of the earth that is opposite to us; it is divided into terraces, and its top is the terrestrial paradise, the first abode of man. From this, the poet ascends through the seven planetary heavens, the heaven of the fixed stars, and the 'primum mobile,' to the empyrean, or fixed seat of God. In all parts of the regions thus traversed, there arise conversations with noted personages, for the most part recently deceased. At one time, the reader is filled with the deepest sorrow, at another, with horror and aversion; or the deepest questions of the then philosophy and theology are discussed and solved; and the social and moral condition of Italy, with the corruptions of church and state, are depicted with a noble indignation.

Fifty-two years after the poet's death, the republic of Florence, at the instigation of Boccaccio, set apart an annual sum for public lectures to explain the *Divine Comedy* to the people in one of the churches, and Boccaccio himself was appointed first lecturer. The example was imitated in several other places of Italy. The works of these men are among the earliest commentaries on D. that we possess. The number of editions of the work amounts by this time to about 300. Only a few, in addition to the commentaries above mentioned, deserve notice. They are: that printed at Fuligno in 1472—the earliest of all; the Nidobeatine edition at Milan (1478); the first Aldine edition (1502); the first Cruscan edition (1695); that of Volpi (1727); of Venturi (1732); of Lombardi (1791), and with additions and illustrations in 1815, 1821, and 1822; of Dionisi (1795); of Ugo Foscolo (Lond. 1842—1843). A reprint of the Fuligno edition above mentioned, together with those printed at Jesi (1472), at Mantua (1472), and at Naples by Francisco del Tuppo (about 1478), appeared at London, in 1858, under the superintendence of Sir Antonio Panizzi, and at the expense of Lord Vernon.

The *Divina Commedia* has been translated into almost all European languages. Two translations of the whole into Latin have been printed, one by Carlo d'Aquino (1728), and lately by Piazza (1848). In French, there are a number of translations both in prose and verse. The earliest, by Grangier, in 1596, is still the nearest to the original in form, but none is good. The German translations are numerous, and such as no other modern language can equal in faithfulness. Kannegiesser has translated the whole in the measure and rhyme of the original (4th edition, Leip. 1843); King John of Saxony's translation is said by some to be the best. The chief English translations are Boyd's (1785) and Cary's (1814), in blank verse (see 'Chandos Classics' London, Warne and Co.); Wright's (1833), in triple rhymes; Cayley's, in the original ternary rhyme (the *Inferno*, 1851, the *Purgatory*, 1853, the *Paradiso* in 1854, with notes in 1855); Dr. John Carlyle's the *Inferno*, in prose, with commentary (1849); Fred. Pollock's, in blank verse (1854); H. W. Longfellow's (1867), in blank verse, with D.'s ternary arrangement of lines. D. wrote other works.

DANTON, GEORGES-JACQUES, was born at Arcis-sur-Aube, 28th October 1759. At the outbreak of the French Revolution, he was practising as an advocate in Paris, but did not enjoy much reputation, on account of his dissolute habits. The fierce half-savage nature of the man, however, immediately found a fitting sphere for its action in the chaos in which France then fell. Mirabeau quickly detected his genius, and hastened to attach D. to himself. President of the district of the Cordeliers, D. ruled it at his will. Along with Marat, and Camille Desmoulins, he instituted the Cordeliers' Club, an exaggerated copy of that of the Jacobins. It soon became the rallying-point of all the hotter revolutionists. There the tall brawny man, with harsh and daring countenance, terrible black brows, and a voice of enormous power, thundered against the aristocrats, till the passions of the populace rose into ungovernable fury. It was not, however, till after the flight of Louis that the political rôle of D. commenced. On the 17th July 1791, he and others assembled the people of Paris in the Champ-de-Mars, and goaded them on by furious declamation to sign a petition for the deposition of the king. Some time after, he became *procureur-substitut* for the city of Paris. The court, which found that it could not frighten D., now attempted to bribe him. It is not certain that he proved venal, but the evidence undoubtedly leaves a strong suspicion of his venality on the mind. Be that as it may, he soon broke off his secret intercourse with the royalist agents, and became more the implacable enemy of the monarchy than before. It was D. who excited to action the wild sanguinary rabble that, on the 10th of August 1792, stormed the Tuileries, and butchered the faithful Swiss. The reward of his fatal eloquence was the office of Minister of Justice, and here the gigantic personality of the man seemed to overshadow all the surrounding figures. He stood forth as the incarnate spirit of the Revolution, manifesting alike its heroic audacity in the presence of danger from without, and its maniacal terror in the presence of danger from within. The advance of the Prussians seemed for a moment to inspire France with a panic. On the 2d of September, D. mounted the tribune, and addressed the Legislative Assembly in a speech of power, probably the most effective delivered during the whole of the Revolution. It closed with these words regarding the enemies of France: 'Pour les vaincre, pour les atterrer, que faut-il? De l'audace, encore de l'audace et toujours de l'audace.' France quivered to its core with enthusiasm. 'In a few weeks, fourteen republican armies stood on the field of battle, and repelled with unexampled bravery the aggressions of the allied forces.' But unhappily that 'audacity,' by which alone D. thought it possible for France to save herself, required for its perfection the immolation of the imprisoned royalists. On the very evening when D. spoke, the frightful September Massacres began. D. publicly thanked the assassins, 'not as the Minister of Justice, but as the Minister of the Revolution.' Elected by the city of Paris one of its deputies to the National Convention, he resigned his judicial function, and zealously hurried on the trial of the king. As a proof of his ferocious decision of character when pressed by difficulties, it is recorded that one of his friends having pointed out that the Convention could not *legally* try the king, 'You are right,' instantly replied Danton. 'So, we will not try him; *we will kill him!*' In the meantime, D. was sent on a mission to the army of the north, commanded by Dumourier, with whom he was soon on very close terms of intimacy—too much so, indeed, for the suspicious soul of his old friend Marat. The defection of Dumourier was the signal for Marat to give vent to his suspicions. It therefore became necessary for D. to throw himself again into the van of the revolutionary movement. On the 10th March 1793, he established the 'extraordinary criminal tribunal,' which was at liberty to make what arrests it pleased, and from whose deadly decisions there was no appeal. He also became president of the 'Committee of Public Safety.' D. now set himself to crush the Girondists, or moderate party, alleging, with singular candor, that 'in a revolution the authority ought to belong to the greatest scoundrels.' In this he was supported by Robespierre, now gliding into power swiftly and silently like a serpent. After he had effected his purpose, however, a species of remorse seems to have seized him. He objected to the institution of the guillotine. This trait of moderation lost him the favor of the Jacobins or Mountain party, whose murderous instincts led them to select Robespierre as a chief, on the permanence of whose cruelty more reliance might be placed. Several other indications of returning humanity lessened his influence still more, and at the close of 1793, D. felt that a crisis was approaching. A fruitless attempt was made to reconcile Robespierre and him. They had an interview, but parted on worse terms than ever. It was now a struggle for life between them; but D., sick of the Revolution, and conscious that it was rapidly becoming a *sham* (a thing which D., with all his faults, could not abide), gave himself up to a sort of reckless apathy, which enabled the sleepless Robespierre to ruin him. His friends endeavored to rouse him. 'I would rather be guillotined than guillotine,' he answered. Blinded by the consciousness of his own inherent power, he also declared that his enemies 'would not dare' to lift their finger against him. But men of the stamp of Robespierre—though essentially cowards, and incapable of facing danger with honest straightforwardness—have a certain furtive audacity that emboldens them to attack a greater than themselves, if circumstances are favorable. So Robespierre sprang at D., and so the great anarch perished. On the night of the 30th March 1794, he was arrested, and brought before that Revolutionary Tribunal which he himself had established, summarily condemned, and, along with Camille Desmoulins and others, was guillotined on the 5th of April. He predicted the fate of Robespierre, calling him 'an infamous poltroon,' and immediately added, 'I was the only person who could have saved him.' D. was an atheist—not a calm, thoughtful dispassionate disbeliever in the existence of God, but one who, by his own vices, and the general godlessness of the times in which he lived, had been robbed of the spirit and power of faith in the Unseen. When formally interrogated regarding

his name and dwelling, he replied: 'My dwelling-place will soon be annihilation, and my name will live in the Pantheon of history.'

DA'NUBE (Ger. *Donau*), the second of European rivers, inferior only to the Volga, has its origin in the Brege and Brigach, two mountain-streams rising in the eastern part of the Black Forest, in Baden, at an elevation of 2850 feet above sea-level, in lat. 48° 6′ N., and in long. 8° 9′ E. The total length of the D. is about 1750 miles; the area which it drains is estimated at 250,000 square miles, comprising countries widely varying in climate and productions. The average fall of the D. is 18 inches per mile. At Ulm, it attains a breadth of 108 feet, and before its junction with the Sereth the mean breadth is 6000 feet, and the depth, which at Ulm is 6 feet, and at Passau 16, is here on an average 20 feet. The D. is joined in its course by sixty navigable rivers, and falls into the Black Sea, pouring into it a volume of water nearly equal to that of all the other rivers that empty themselves there. From its source, it flows in a north-easterly direction through Würtemberg and Bavaria. Passing Ulm, at which point the river becomes navigable for vessels of 100 tons, it receives from the south the Lech and the Iser, with some unimportant streams from the north; flows rapidly past Ingolstadt, and onwards to Regensburg (Ratisbon); then suddenly altering its course, it proceeds in a south-easterly direction, passing Straubing and Passau, where it enters the Austrian dominions. With little variation of course, the D. flows eastward from Passau to Presburg, receiving from the south the Inn and the Ens, and from the north the March or Morava, through a tract of country rich in minerals, well peopled, and highly cultivated. Near Linz, and also in the picturesque neighborhood of Vienna, the waters of the D. frequently divide, and enclose large tracts of soil, forming islands, among which are the Great and Little Schütt, called also the 'Golden Gardens.' Hurrying past Presburg, the D. alters its course to south-east, and such is its velocity here, that barges can only navigate it downwards. Passing Pesth, and flowing directly south, it enters upon the Hungarian plain, a vast sandy and alluvial flat, in which it is continually forcing new channels and silting up old ones, sometimes sweeping away towns, or capriciously removing its waters to a distance of several miles from such as were formerly built upon its banks. Here it receives from the north the Waag and the Gran, while the Drave from the west adds considerably to its volume. After this accession, the river turns towards the east, and joined by the waters of the Theiss and Temes from the north, sweeps past Belgrade, forming the boundary between Servia and Hungary. Still flowing eastward, the D., leaving Orsova, passes the famous 'Iron Gate,' a broad plateau of rock 1400 yards wide, over which the water formerly rushed with an overpowering noise.

This rapid, which was followed by a series of whirlpools, eddies, and shallow falls, formed an effectual bar to the upward progress of vessels, no craft drawing more than 2½ feet of water being able to pass it. In 1847—1849, however, the obstruction formed by the 'Iron Gate' was to some extent removed by blasting, so that now vessels of eight, and even nine feet draught, can pass at certain seasons of the year, although the majority of vessels engaged on this part of the river draw no more than four feet of water. A few miles further on, it enters a plain, and proceeding uninterruptedly, forms the boundary between Walachia and Bulgaria. From the Carpathians it receives the Schyl and the Aluta, and from Mount Balkan the Morava. Increased by these rivers and by numberless streams, it progresses through a district fertile indeed, but badly cultivated and thinly peopled, occasionally broadening like a sea, as at Hirsova, and encircling many islands. After being joined by the Sereth and the Pruth from the north, and after dividing into several branches forming deltoid islands, it flows eastward into the Black Sea. The principal mouth is the Sulina, by which the greater number of ships enter. The D., which is the chief natural highway for European commerce, is, throughout the greater part of its course, surrounded by picturesque and impressive scenery—at one time flanked with lofty mountains, again having on each side, dense and far-extending forests. At the peace of Paris in 1856, the navigation of the Danube was declared free to all nations, and its management was intrusted to two commissions, one representing the European powers, another named by the states on the banks of the river. At the Berlin Congress of 1878, it was stipulated that no ships of war should navigate the D. below the Iron Gates. The Danube Steam Navigation Company, which has done much to increase the commerce, possesses upwards of 150 steamers and 600 tow-boats.

DANU'BIAN PRINCIPA'LITIES. See MOLDAVIA and WALACHIA.

DA'NZIG (Polish *Gdansk*), an important seaport of Prussia, and fortress of the first rank, in the province of Prussia, is situated on the left bank of the western branch of the Vistula, about 3½ miles from its mouth in the Baltic. D. is an ancient place, having been in existence at least as early as the 10th c., and its possession was long an object of ambition to the Danes, Swedes, Pomeranians, and Teutonic knights, the last of whom obtained, and held it for a considerable period. In 1454, it became a free city under Poland, and remained so until 1793, when it fell under the dominion of Prussia, in whose hands, except during the years 1807—1814, when it existed as a separate dukedom under Napoleonic rule, it has since continued. D. is surrounded by ramparts and wet ditches, and is otherwise strongly fortified, and the garrison possesses the means of laying the surrounding country under water on three sides.

The city is traversed by the Motlau and Radaune, tributaries of the Vistula, the former of which is deep enough to admit vessels of eight or nine feet draught up to the town. The principal port, however, is at Neufahrwasser, at the mouth of the Vistula, which river cannot be entered by large vessels on account of the sand-bars across it. Many of the streets of D. are narrow and crooked, but the principal street, intersecting it from east to west, abounds in fine specimens of antique architecture, and has altogether a most picturesque appearance. Among the most noteworthy buildings are the cathedral, a fine structure, commenced in 1343, but not finished until 1503, and possessed of a noble and widely celebrated picture of the 'Last Judgment' (the painter of which is unknown), the Church of St. Catharine, Trinity Church, the fine old Town-hall (which has lately been restored at a cost of 60,000 thalers), the Exchange, &c. D. was at one time a prominent member of the Hanseatic League, and is still one of the chief commercial cities of Northern Europe. To provide for its immense trade in grain, it has enormous granaries, capable of containing 500,000 quarters of corn, and built on an island forming one of the parts of the town where, in order to prevent fire, no person is permitted to live, nor lights allowed. In 1880, 105,034 tons (of 1000 kilos.) of wheat and other grain were exported, of which 39,939 tons went to Great Britain. The value of timber exported in 1879 was £573,755; and in 1880, £808,800; the largest quantity going to Great Britain. Besides grain and timber, there are some minor articles of export, as black beer, amber, spirits, &c. The annual value of the exports is about £3,000,000 or more; of the imports about twice as much. In 1880, 1894 vessels entered, and 1876 cleared the harbor. The inhabitants of D., of whom the majority are Protestants, numbered in 1880, 108,551.

DAOUDNU'GUR, a town in the province of Behar in India, stands on the right bank of the Sone. D. is about 90 miles to the east of Benares, being in lat. 25° 3′ N., and long. 84° 27′ E. It is a wretched-looking place, most of its thoroughfares being mere passages. It possesses, however, a considerable trade, manufacturing coarse fabrics both of wool and cotton. Pop. (1871) 10,058.

DAOU'RIA, a country of Asia, partly in the Russian government of Irkutsk, and partly belonging to the Chinese territory of Mantchuria. Its limits are not exactly defined. The Daourian mountains, offsets of the Yablonoi mountains, traverse it from north-east to south-west, and separate it from the region of Lake Baikal. The mountains are fertile in minerals.

DA'PHNÉ, a magnificent grove and sanctuary in ancient times, near Antioch (q. v.). The grove was finely laid out in walks of cypress and bay trees, and as the chief resort of all the dissolute persons in the city, became the scene of the greatest debauchery. In the center, surrounded by the luxuries of nature and art, glorious gardens, fountains, baths, colonnades, stood the temple of Apollo and Diana, which was invested with the privileges of an asylum, and became for centuries a place of heathen pilgrimage. The progress of Christianity gradually revived in the Antiochenes the purer instincts of virtue and decorum, and the grove was finally abandoned. Julian the Apostate, in his vain endeavor to resuscitate the lifeless corpse of paganism, visited D., and made the altars of the temple smoke once more with incense; but on his departure, they were again neglected, until one night the altars and the statues were discovered to be in flames. They were consumed to ashes; and so perished forever the gods of Daphne.

D. owed its origin to Seleucus Nicator. He planted the grove, built the temple, and gave the place a mythological history in connection with the river Peneus and the nymph Daphne, who was here turned into a laurel or bay tree, whence the grove of D. receives its name. Modern travelers are not agreed as to its site. Pococke and Richter decided in favor of *Beit-el-Maa*, about five miles from Antioch; while Forbiger and Kinneir consider Babylas the true position.

DAPHNE, a genus of plants of the natural order *Thymeleaceæ*, having a 4-cleft, funnel-shaped perianth, the throat of which is destitute of scales, eight stamens, and a one-seeded succulent fruit. All the species are shrubs or small trees, some having deciduous, and some having evergreen leaves, all of them possessing in all their parts a more or less considerable acridity, which in some is so great, that they are even caustic; and the berries are poisonous, whilst, however, the flowers of some are deliciously

fragrant. To this genus belongs the DAPHNE MEZEREON, well known both for the fragrance of its flowers and for its medicinal uses, naturalized in some places in England. The GAROU bush (*D. gnidium*), a native of the south of Europe, less hardy than the mezereon, has the same medicinal properties and uses, which is also in some measure the case with many other species. The only species certainly a native of Britian is the SPURGE LAUREL (*D. laureola*), an evergreen shrub, 3—4 feet high, with obovate-lanceolate leaves, which grow in tufts at the end of the branches, and give it a remarkable appearance. It grows well under the shade of trees. It is naturalized, rather than a native of Scotland.—*D. Japonica*, a species recently introduced from Japan, has exquisitely lemon-scented leaves. From the bark of some species of D., and of the most nearly allied genera, paper is made in different parts of the East, particularly *Nepaul paper* from that of *D. cannabina*.

Slips of the inner bark are boiled in a lye of wood-ashes for half an hour till quite soft, are then reduced to a homogeneous pulp by beating with a wooden mallet in a mortar, churned with water into a thin paste, and poured through a coarse sieve upon a cloth stretched on a frame. The paper is subsequently polished by friction, with a shell or a piece of hard-wood, and is remarkable for its toughness, smoothness and durability. Most of the paper used in Tibet is made from the bark of different species of D. and allied genera, particularly of *Edgeworthia Gardneri*, a beautiful shrub, with globes of waxy, cowslip-colored, deliciously fragant flowers, growing on the Himalaya, at an elevation of 6000—7000 feet. The bark of *Dais Madagascariensis* is also made into paper in Madagascar, and that of *Gnidia daphnoides* into ropes.

Daphne Mezereon.

DA'PHNIA. See WATER-FLEA.

DA'PHNINE is a bitter, astringent, crystalline substance present in different species of *Daphne*. It is analogous to asparagine. See ASPARAGUS.

DARABGHE'RD, or DARA'B, a town of Persia in the province of Farsistan, lat. 29° N., long. 54° 30′ E. It is situated on a small river in the midst of an extensive plain, and is surrounded by lemon and orange groves. At one time it was a place of great extent and importance, but most of it is now in ruins, and its population is not more than 15,000 or 20,000.

D'ARBLAY, MADAME. See BURNEY, DR. CHARLES.

DARAGU'NJ, a town of British India on the left bank of the Ganges, opposite to Allahabad. Pop. 9000.

DARBU'NG, a mountain-torrent of Bussahir, Hindustan, with a course of only 27 miles, rises about 15,000 feet above the sea, in lat. 31° 57′ N., and long. 78° 25′ E., and loses itself in the Sutlej, the most easterly of the five rivers of the Punjab, in lat. 31° 43′ N., and long. 78° 35′ E. About 7 miles above the point of confluence —having already descended 6000 feet in 20 miles—the D. is crossed by a wooden bridge of 33 feet in length; and even somewhat further up, it is bordered by several villages. Its source has been described as a scene of terrific desolation, consisting of fields of snow and ice half-hid under stones and rubbish.

DARDANE'LLES (ancient *Hellespont*), a narrow channel separating Europe from Asia, and uniting the Sea of Marmora with the Grecian Archipelago. It extends from north-east to south-west, between lat. 40°—40° 30′ N., and long. 26° 10′—26° 40′ E., having a length of about 40 miles, and a breadth varying from less than 1 to 4 miles. From the Sea of Marmora, a strong current runs through the strait to the Archipelago. To prevent an attack on Constantinople from the Archipelago, the D. is strongly fortified on both sides, with many guns of immense calibre. A treaty concluded between the five great powers and Turkey in 1841 arranged that no ship of war belonging to any nation save Turkey should pass the D. without the express consent of Turkey; all merchant ships being also required to show their papers to the Ottoman authorities. These provisions were confirmed at London in 1871 and at Berlin in 1878. The D. is celebrated in ancient history on account of Xerxes and Alexander having crossed it, the former in 480 B.C., to enter Europe; and the latter in 334 B.C., to enter Asia. The point at which Xerxes crossed, by two separate bridges, was in the neighborhood of Abydos, on the Asiatic shore, opposite to Sestos. Alexander crossed at nearly the same place; and here also young Leander nightly swam across to visit Hero—a feat performed in modern times by Lord Byron for 'glory.'

DARFU'R, a country of Africa, east of Sudan, is generally said to be situated in lat. 10°—16° N., and in long. 22°—28° E., but its limits are not very clearly defined. D. towards the south is hilly, the principal elevation being a mountainous ridge called Marrah, which traverses the country longitudinally, and is the source of numerous streams. Towards the north, D. is level, sandy, and almost destitute of water. During the rainy season, which commences in June, and continues till September, it exhibits a rich vegetation. The principal products are wheat, millet, rice, maize, and sesame. Tobacco, which is used by the natives in every form, abounds. Water-melons, also, are abundant during the rainy season. Among the fruits are tamarinds and dates. The minerals are chiefly copper and iron. The wealth of the inhabitants of D. consists chiefly in cattle. Horses, sheep, camels, and game abound. D. carries on a considerable trade with Egypt, Mecca, and the inland countries of Africa; it was once a notorious center of the slave-trade. The Furani are an intelligent, well-built race, and have long been Mohammedans. Their numbers are variously estimated at from three to four millions, the former estimate being that of the Egyptian governor-general. D. was annexed to Egypt in 1874–75, and the organization of the country into four provinces (Umshanga, Fasher, Dara, and Kakkabia) is now complete. The residence of the governor is Fasher, whence a regular postal service conveys letters to Khartum in 10 days. Kobe is the chief trading town.

DA'RGAN, WILLIAM, was born about the beginning of the present century in county Carlow, Ireland, where his father was a large farmer. D. received, when young, a good education, and after spending some time in the office of a surveyor, where he acquired a high reputation for integrity and assiduous industry, he went to England, and was employed under Telford, who was then constructing the Holyhead Road. Inspired perhaps by the example of that great engineer, D. now resolved to carve out a similar path for himself in his own country, and having returned to Ireland, obtained some small 'jobs,' the beginnings of a career crowned with the most splendid success—for he became one of the first capitalists in Ireland. It was D. who contracted for the first railway ever executed in Ireland (the Dublin and Kingstown), and he was afterwards connected with most of the great undertakings in that country, such as the making of railways, canals, tunnels, and embankments. He was also an extensive holder of railway stock, a steam-boat proprietor, flaxgrower, and farmer. He planned the Industrial Exhibition of Dublin (1853), with the view of developing more vigorously the material resources of his native country; and as a help towards its realization, placed £20,000 in the hands of a working-committee. This sum was gradually increased to about £100,000. The Exhibition was opened on the 12th of May 1853, by the Lord-lieutenant; and was visited by the Queen and Prince Albert, when the honor of knighthood was offered to D., but was declined. In so far as the Industrial Exhibition was a *personal* speculation on the part of D., it was a failure, for he lost, it is said, £20,000 by it; but in every other respect it was highly gratifying to him, and to every genuine lover of his country. William D. was not one of those sham-patriots with whom Ireland has been too often afflicted. He died, February 7, 1867.

DARIEN, the name of a gulf on the northern coast of S. America, and of the isthmus connecting the grand northern and southern divisions of the new world.—1. Gulf of D., the most southerly portion of the Caribbean Sea, about 70 miles in length from north to south, and 25 from east to west. The shores are in most places steep, and are in many places fringed with shoals. The southernmost part of the gulf is called the Bay of Choco, into which the considerable river Atrato debouches.—2. The Isthmus of D. is a term commonly used as interchangeable with that of Isthmus of Panama (q. v.), now the more usual name. D. was also the name given to a province in the republic of New Granada, corresponding to what is now the state of Panama in Columbia. One of the earliest Spanish settlements on the mainland was in D., the region being then called also by the Spaniards *Castilla de Oro* ('the Golden Castile') and forming the best known part of their *Tierra Firma*. In 1513, the conquistador Balboa, governor of the Darien settlement, crossed the isthmus with 290 men, and on 26th September first caught sight of the Pacific Ocean.

As early as 1528 the idea of a ship canal across the isthmus was entertained; in 1826 a line for such a canal was traced between Panama and Portobello; and between 1843 and 1874 repeated surveys have been made by French, English, and American engineers with the same view. The Interoceanic Canal Congress which met at Paris in 1879, under the auspices of M. Lesseps, ap-

proved a route nearly parallel to the railway. A company was formed in 1880, under the auspices of M. Lesseps, to make the canal; and operations were commenced in 1881. The work is a level cutting, without locks, and the estimated cost is £33,000,000. For the railway from Aspinwall to Panama, see PANAMA. The principal ports on the north shore are Chiriqui, Colon or Aspinwall on Limon Bay, Portobello, San Blas, and Puerto Escoces, on Caledonia Bay.

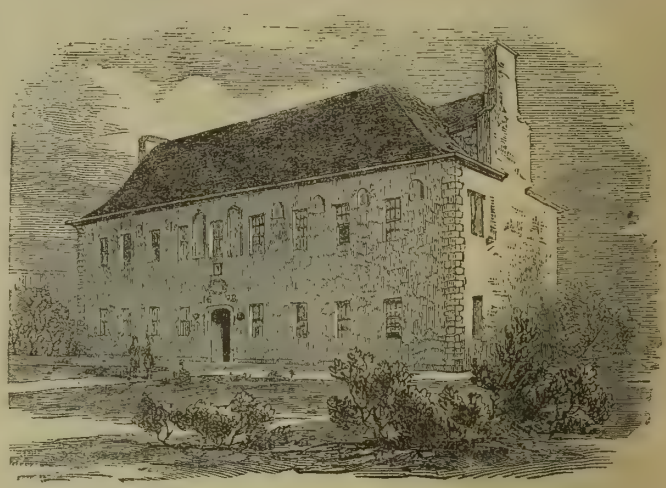
DARIEN SCHEME, THE, one of the most disastrous speculations on record, and one which caused an unprecedented excitement in Scotland from 1695—in which year the Darien Company was established by act of the Scottish parliament, sanctioned by royal authority—till 1701, when the last of the disappointed adventurers returned home. The D. S. was projected by William Paterson, the founder of the Bank of England. Its object was to plant a colony on the Atlantic side of the Isthmus of Panama, and so form a commercial entrepôt between the eastern and western hemispheres. An entire monopoly of the trade of Asia, Africa, and America, for a term of thirty-one years, was granted to the Company. At that time, the foreign trade of Scotland had been ruined by the English navigation act of 1660, which provided that all trade with the English colonies should be conducted in English ships alone, so that when Paterson opened his subscription-list, the nobility, the gentry, the merchants, and people, royal burghs, and public bodies in Scotland all hastened to subscribe. £400,000 were immediately put down on paper, of which £220,000 were actually paid up. Deputies in England received subscriptions to the amount of £300,000; and the Dutch and Hamburgers subscribed £200,000. The English parliament, however, actuated by a feeling of national antipathy, and the jealous clamors of trading corporations, gave its unequivocal condemnation to the scheme. The British resident at Hamburg, probably with the concurrence of the king (William III.), also made various insinuations against it. The result of this interference was the almost total withdrawal of the Dutch and English subscriptions. It must now be admitted, even by a Scotsman, that there *was* one fatal objection to the scheme—viz., the danger of settling on ground claimed by Spain, without coming to a proper understanding with that country beforehand. Unable, however, to see any sort of obstacles, incited by the vehement eloquence of Paterson, and dazzled by the magnificent proportions of the scheme, the Scotch hurried forward their arrangements. Five ships, with 1200 men on board, set sail from Leith for Panama on the 25th July 1698.

They reached their destination in four months, and having bargained with the natives for a country which they called New Caledonia, the colonists fixed the site of what was to be their capital city, New Edinburgh, and built a fort in its vicinity, which they named New St. Andrews. Having thus constituted their colony, they issued a proclamation of perfect freedom of trade, and universal toleration in religious matters to all who should join them. According to the act which established their company, all goods imported by them, with the exception of foreign sugar and tobacco, were free from all duties and impositions for 21 years; and thus on the whole, they seemed for the first few months to be on the highway to success. But the climate, which was tolerable in winter, became unbearable in summer, and many sickened under it; their supplies also failed before they could derive a return from the soil; and on sending to the British colonies in America for provisions, they learned with the deepest indignation and despair that the British American colonies, having been informed that King William had not given his sanction to the expedition, had resolved to hold no intercourse with the new colony at Panama.

Sickly and desponding, they waited long for supplies from the mother-country; but the Company at home were not aware of their wretched condition, and none came. At length having waited eight months for assistance, the colony broke up. In the meantime, 1300 colonists, including 300 Highlanders from the estate of Captain Campbell of Finab, who had charge of the expedition, had set sail from Scotland, but ere they arrived, the pioneers had fled. A Spanish force of 1500 men, and a squadron of 11 ships, immediately threatened the new comers. Captain Campbell marched by night with a body of 200 men upon the Spanish camp, which he broke, and completely dispersed. On returning to the fort, however, he found it invested by the Spanish squadron. The ammunition of the colonists had now become exhausted, and they were obliged to capitulate, the Spaniards granting honorable terms to all except Captain Campbell, who, however, escaped, and reaching New York, obtained a passage to Scotland. The remainder of the colonists, too weak to weigh the anchor of the vessel which was to carry them home, had to be assisted in their departure by the Spaniards. Not more than 30, among whom was Paterson, who was rendered for a time lunatic by his dreadful misfortunes, ever reached Scotland.

Of Paterson, who has been regarded by some writers as a swindler, Lord Macaulay, in his fifth volume of the *History of England*, says: 'There is not the least reason to believe that he was dishonest. Indeed, he would have found more difficulty in deceiving others, had he not begun by deceiving himself. His faith in his own schemes was strong even to martyrdom; and the eloquence with which he illustrated and defended them had all the charms of sincerity and enthusiasm.'

In Edinburgh, as the head-quarters of the D. S., a building was erected to accommodate the officials, and carry on the business of



Scottish India House.

the Company. Known as the Scottish India House, this building, now removed, recently existed in connection with the establishment for the poor of the city—a melancholy memorial of a disconcerted national enterprise. The books and other documents which had belonged to the Company are contained in the Advocates' Library, where they are shown as a curiosity. The most complete account of the D. S. is that by Mr. J. H. Burton, printed by the Bannatyne Club.

DARI'US, or DAREIUS, is the name of several Persian kings, and, like the Egyptian word Pharaoh, is *titular* and not *personal*.—DARIUS I., the son of Hystaspes, a Persian noble, leagued himself with six other nobles to murder Smerdis, the Magian, who had usurped the throne on the death of Cambyses. The conspirators were successful in their plot, and having, after some discussion, fixed on the monarchical as the proper form of government, D. contrived to be elected king, 521 B.C. His position at first was very insecure, but his caution, skill, and energy enabled him to govern his vast dominions for thirty-six years. To strengthen himself, he married the daughter of Otanes, who had been the head of the conspiracy, and likewise took three wives from the royal house—viz., two daughters of Cyrus, and one of Cyrus's son, Smerdis. He then divided his empire into twenty satrapies, and determined the exact amount of taxation to be borne by each. In some of the remoter provinces, great confusion seems to have prevailed after the death of Smerdis, the Magian; and a proof of how little D. could effect at first is afforded by the conduct of Orœtas, the governor of Sardis, who for some time was quite defiant of his authority.

Babylon next revolted, and D. besieged the city unsuccessfully for two years. At last, however, it was taken by an extraordinary stratagem of his general Zophyrus, 516. In 513, D., with an army of 700,000, crossed the Bosporus by a bridge of boats, marched through what is now known as European Turkey, to the mouths of the Danube, crossed and advanced against the Scythians. The expedition proved a failure. D. retreated, but detached from his main force an army of 80,000 men under Megabyzus, to conquer Thrace, while he himself returned to Persia, where he extended his authority in the East as far as the Indus. The assistance given by the Athenians and Eretrians to the Ionic states, when they ventured to throw off the Persian yoke, and the part which they took in the burning of Sardis, determined D., who was also influenced thereto by the banished Hippias, to attempt the subjugation of the whole of Greece. In 495, he sent Mardonius with an army into Thrace and Macedonia, and at the same time despatched a fleet against the islands. The former was routed by the Brygi in Thrace, the latter was shattered and dispersed by a storm when rounding the promontory of Mount Athos. In 490, he renewed his attempt. His fleet committed great ravages in the Cyclades, but his army was entirely defeated at Marathon by the Athenians, under Miltiades, the 'tyrant' of the Chersonese. In the midst of his preparations for a third expedition, D. died 485 B.C.

DARIUS II., called, before his accession to the throne, *Ochos*,

and after his succession, *Nothos* ('the Bastard') was one of the seventeen bastard sons of Artaxerxes I. Longimanus. When Sogdianus, another of the bastards, had murdered the rightful king, Xerxes II., and assumed for himself the royal power, Ochos declared war against him, slew him, and secured the diadem for himself, 424—423 B.C. He now called himself *Darius*. His reign was ignoble. He showed himself to be completely under the control of his eunuchs and his cruel step-sister and spouse Parysatis. Rebellions were constantly breaking out among his satraps, all of which, however, were crushed except that of Amyrtæus, satrap of Egypt, who made himself independent in 414. It was during the life of D., and chiefly through the craft of Tissaphernes, satrap of Asia Minor, and of his successor Cyrus the Younger, son of the king, that the Persians exercised so great an influence over the affairs of Greece in the last years of the Peloponesian War. D. died 405—404 B.C.

DARIUS III., great-grandson of D. II., called before his accession, *Codomannus*, was a monarch noted for his mild disposition, handsome person, and courageous spirit. He was raised to the throne through the help of Bogoas, after the murder of Arses, 336 B.C. But in spite of his superior qualities, he could offer no solid opposition to the advance of the Macedonians. At the battle of the Issus, in 333, his mother, wife, and three children fell into the hands of Alexander; the victory of Gaugamela, in 331, opened to the latter the way to Susa and Persia Proper. D. now fled to Ecbatana, in Media; and, on the approach of his opponent, to the northern provinces, where he was seized by Bessus, satrap of Bactria.

Alexander, in a fit of generosity, hurried to deliver Darius. Bessus then prepared for flight, but D., refusing to follow, was stabbed by the barbarian, and left. The scouts of Alexander's cavalry, found D. dying, and administered to his last necessities. Thanking the Grecian king for his magnanimity, and commending his family to his care, he expired (330). Alexander sent the dead body to Sisygambis, mother of D., to be interred in the tomb of the Persian kings. With him, the Persian empire, that had so long overshadowed Asia, came to a close.

DARJEEL'ING, a sanitary station of British India, capital of a district in the Sikkim Himalaya. It is situated at an elevation of 7400 feet above the sea, on a narrow ridge between deep valleys. The Lieutenant-governor of Bengal spends some months here in summer. Forest-covered mountains rise above it, where the rhododendrons of the Himalaya grow in great luxuriance. It commands a magnificent view of the snowy ranges of the Himalaya to the north and west. Notwithstanding frequent heavy rains, and a very great annual rainfall, the climate is very salubrious. It was obtained by the British government from the Rajah of Sikkim in 1835. Tea culture has been extensively introduced.

DARKHA'N, MOUNT, a lofty granite mountain in Mongolia, in lat. 47° 36′ N., long. 110° 10′ E. It is interesting as the place whither annually repair large numbers of Mongolians, to do honor to the memory of Genghis Khan (q. v.), to whom a monument has been erected here.

DA'RLING, GRACE, a name famous in the annals of heroism, was the daughter of William Darling, light-house keeper on Longstone, one of the Farne Islands, and was born at Bamborough, 24th November 1815. On the morning of the 7th September 1838, the *Forfarshire*, which, with 63 persons on board, had been wrecked among the Farne Islands, was seen by Darling from his light-house, lying broken on the rocks. At the solicitation of his daughter, then in her 22d year, he put off through the storm to the wreck, his only companion the noble girl who prompted the generous act. By wonderful strength and skill, they brought their boat to where the sufferers (nine in number) crouched, in momentary expectation of a watery grave, rescued them, and bore them safely to Longstone. Such an undertaking, so daring in itself, and so successfully carried out, filled every one with the warmest admiration. The light-house at Longstone, no longer solitary and peaceful, was visited by many of the wealthy and the great. Presents, testimonials, and money were heaped at the feet of the heroine; but she did not long survive her change of circumstances. She died of consumption, after a year's illness, on Oct. 20, 1842. See *Grace Darling*, by E. Hope (1876).

DA'RLING, a name derived from a governor of New South Wales, and applied to a district, a mountain-range, and a river in Australia.—1. The Darling Downs district includes an extensive tract near the Dividing Range in the south of Queensland. The district has an area of about 6000 square miles, and is watered by the Condamine, Weir, and Moonie rivers.

It is the richest pastoral district in the colony, and comprises a vast extent of fine agricultural land.—2. A mountain-range, running N. and S., about 250 miles long, lying wholly in West Australia. It terminates in the direction of the sea at Point d'Entrecasteaux. Its culminating summit is not less than 3000 feet above the sea-level.—3. The river Darling, in New South Wales, aptly characterized as 'mysterious,' demands special attention, not only in itself, but also in connection with some of the most striking peculiarities of the country. From the western declivities of the almost continuous ridge that skirts the eastern coast, innumerable torrents pour down into the vast plains, which gradually slope away towards the interior. The more northerly of these torrents converge in a central 'basin of clay,' on the 30th parallel of S. lat., where, within a comparatively narrow space, meet the Maraona, the Condamine, the Dumaresque, the Gwydir, the Naomi, the Castlereagh, the Macquarie, and the Bogan. In this region, the channels undergo many transformations, sometimes losing themselves in wide marshes, and sometimes presenting an inextricable labyrinth of bifurcations and junctions. After parting with a large proportion of their volume, under the combined influences of evaporation and absorption, the united streams, now distinguished as the D., pursue a journey of 600 miles to the Murray, through plains which are habitable only on the immediate verge of the water-course. Through this immense reach, the D. receives not a single affluent; nay, on the contrary, it sends out many an offset, to bury itself in some stagnant lagoon. It may be added, that none of the so-called rivers of this region of Australia, with the solitary exception of the Murray itself, is really entitled to the name. Between lofty banks of bare earth, they exhibit at times an inundating flood, at times a mere series of detached pools of every size and shape.

DA'RLINGTON, or DA'RNTON, a burgh in the south of Durham county, in a rich tract, on a hill-slope, on the banks of the Skerne, near its junction with the Tees, 18 miles south of Durham city. It consists of a square market-place, from which branch several streets called gates. Pop. in 1881, 35,102, many belonging to the Society of Friends. The chief manufactures are woollen yarns, for imitation Indian shawls, Brussels carpets, &c.; flax, optical glasses, brass and iron wares. Near D. was the seat of George Allen the antiquary. St. Cuthberts, the beautiful parish church, was built in the 12th c., and has three carved stone stalls, and a tower 180 feet high. At Oxen-le-field, three miles from D. are curious cavities of unknown origin, called Hell Kettles.

DA'RMSTADT, a town of Germany, capital of the grand-duchy of Hesse-Darmstadt, residence of the grand duke, and seat of government, is situated on the river Darm, 15 miles south of Frankfurt-on-the-Maine. It consists of an old and new town, both of which are surrounded by walls and ditches. The streets of the former are narrow and squalid, but those of the latter exhibit many imposing specimens of architecture. D. has five public squares, from the center of one of which a fine Doric column rises to the height of 134 feet, and is surmounted by a statue of the Grand Duke Louis, who founded the new town. Besides the arsenal, the barracks, and the various religious edifices, one of which is crowned by a dome supported upon 28 large columns, D. has two palaces; one of these, the old ducal palace, contains the museums of painting—comprising 700 pictures, some of them by the most famous of the old masters—and natural history, in which are shown fossil remains of the deinotherium. The palace contains also a public library consisting of 380,000 vols. D. is more dependent upon its ducal court and the government, which holds its seat there, than upon its commerce or manufactures; but these are now becoming more important. Pop., with suburb (1880), 48,153.

DA'RNEL (*Lolium temulentum*), a grass of the same genus with the valuable RYEGRASS (q. v.), an annual, common in cornfields in England and many parts of Europe. It has no tufts of leaves from the root, the glumes are as long as the spikelets, or longer, the spikelets contain 5—7 florets which are awned. This grass has from ancient times been reputed to have a narcotic poisonous seed, to which many bad effects were ascribed, which, in years of bad harvest, were observed to ensue upon the eating of bread or the feeding of horses upon oats. Even Lindley, in his *Medical and Œconomical Botany*, published in 1849, ascribes narcotic and acrid qualities to D. seed, and speaks of fatal consequences as produced by it when mixed with flour, saying that it 'is the only authentic instance of unwholesome qualities in the order of the Grasses.' On the other hand, it is asserted that very recent researches on the continent have completely established the perfect harmlessness of this grass and of its seed; and the effects which have been ascribed to it must therefore be regarded as proceeding from grain injuriously affected in some way by bad weather.

Darnel.

DARNETAL, a town of France, in the department of Seine-Inférieure about 2½ miles east of Rouen. It is well built, and has two Gothic churches. Situated at the top of a narrow valley, and intersected by two streams, D. possesses unusual facilities for carrying on cloth and other woollen manufactures. Pop. (1876) 5618.
